

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

THE CENTURY DICTIONARY

PREPARED UNDER THE SUPERINTENDENCE OF
WILLIAM DWIGHT WHITNEY, PH. D., LL. D.

PROFESSOR OF COMPARATIVE PHILOLOGY AND SANSKRIT IN YALE UNIVERSITY

THE plan of "The Century Dictionary" includes three things: the construction of a general dictionary of the English language which shall be serviceable for every literary and practical use; a more complete collection of the technical terms of the various sciences, arts, trades, and professions than has yet been attempted; and the addition to the definitions proper of such related encyclopedic matter, with pictorial illustrations, as shall constitute a convenient book of general reference.

About 200,000 words will be defined. The Dictionary will be a practically complete record of all the noteworthy words which have been in use since English literature has existed, especially of all that wealth of new words and of applications of old words which has sprung from the development of the thought and life of the nineteenth century. It will record not merely the written language, but the spoken language as well (that is, all important provincial and colloquial words), and it will include (in the one alphabetical order of the dictionary) abbreviations and such foreign words and phrases as have become a familiar part of English speech.

THE ETYMOLOGIES.

The etymologies have been written on a uniform plan, and in accordance with established principles of comparative philology. It has been possible in many cases, by the use of the fresh material at the disposal of the etymologist, to clear up doubts or difficulties hitherto resting upon the history of particular words, to decide definitely in favor of one or the other of several suggested etymologies, to discard numerous current errors, and to give for the first time the history of many words of which the etymologies were previously unknown or inaccurately stated. Beginning with the earliest accepted form of spelling, each important word has been traced back through earlier forms to its remotest known origin. The various prefixes and suffixes useful in the formation of new words are treated very fully in separate articles.

HOMONYMS.

Words of various origin and meaning, but of the same spelling, have been distinguished by small superior figures (1, 2, 3, etc.), numbering these homonyms the rule has been to give precedence to the oldest or the most familiar, or to that one which is most English in origin. The superior numbers apply not so much to the individual word as to the group or root to which it belongs, the different grammatical uses of the homonym are numbered alike when they are separately entered in the Dictionary. A verb and a noun of the same origin and the same present spelling receive the same superior number. But when two words of the same form and of the same radical origin now differ considerably in meaning, so as to be used as different words, they are separately numbered.

THE ORTHOGRAPHY.

Of the great body of words constituting the familiar language the spelling is determined by well-established usage, and, however accidental and unacceptable, in many cases, it may be, it is not the office of a dictionary like this to propose improvements, or to adopt those which have been proposed and have not yet won some degree of acceptance and use. But there are also considerable classes as to which usage is wavering, more than one form being sanctioned by excellent authorities, either in this country or Great Britain, or in both. Familiar examples are words ending in *or* or *our* (as *labor, labour*), in *er* or *re* (as *center, centre*), in *ize* or *ise* (as *civilize, civilise*); those having a single or double consonant after an unaccented vowel (as *traveler, traveller*), or spelled with *e* or with *æ* or *œ* (as *hemorrhage, hæmorrhage*); and so on. In such cases both forms are given, with an expressed preference for the briefer one or the one more accordant with native analogies.

No attempt has been made to record all the varieties of popular or even educated utterance, or to report the determinations made by different recognized authorities. It has been necessary rather to make a selection of words to which alternative pronunciations should be accorded, and to give preference among these according to the circumstances of each particular case, in view of the general analogies and tendencies of English utterance. The scheme

THE PRONUNCIATION.

ical arts and trades, and of the philological sciences, an equally broad method has been adopted. In the definition of theological and ecclesiastical terms, the aim of the Dictionary has been to present all the special doctrines of the different divisions of the Church in such a manner as to convey to the reader the full intent of those who accept them. In defining legal terms the design has been to offer the information that is needed by the general reader, and also to aid the professional reader by giving in a concise form all the important technical words and meanings. Special attention has also been paid to the definitions of the principal terms of painting, etching, engraving, and various other art-processes; of architecture, sculpture, archaeology, decorative art, ceramics, etc.; of musical terms, nautical and military terms, etc.

ENCYCLOPÆDIC FEATURES.

The inclusion of so extensive and varied a range, the introduction of special phrases, full description of things often bound to an intelligible definition of their meaning, could alone have given to this Dictionary an encyclopedic character. It has, however, been deemed desirable to go somewhat further in this direction than these considerations strictly necessary. Originally, not only have many technical terms been treated with unusual fulness, but practical information of a kind which has hitherto been excluded has been included. The result is that "The Century Dictionary" covers to a great extent the field of a general encyclopedia, with this principle—namely, that the information given is not part distributed under the initials of words and phrases with which it is connected, but being collected under a few topics. Proper names, both biographical and geographical, are of course omitted, except where they appear in derivative adjectives, as in *from Darwin*, or *Indian from India*. The alphabetical distribution of the encyclopedia under a large number of words is believed, we found to be particularly useful in the search for those details which are usually looked for in works of reference.

ILLUSTRATIONS.

Pictorial illustrations have been secured and executed as to be subordinate to the text, but possessing a considerable degree of interest, suggestiveness and artistic value. The technical accuracy, the illustrations, as a rule, been selected by the specialists of the various departments, and have been examined by them in proofs. The number about six thousand.

MODE OF ISSUE, PRICE, ETC.

"The Century Dictionary" will be comprised in about 6,500 quarto pages. It is published by subscription and in twenty-four parts or sections, to be finally bound into six quarto volumes, if desired by the subscriber. These sections will be issued about once a month. The price of the sections is \$2.50 each, and no subscriptions are taken except for the entire work.

The plan for the Dictionary is more fully described in the preface (of which the above is part a condensation), which accompanies the first section, and to which reference is made.

A list of the abbreviations used in the etymologies and definitions, and keys to pronunciations and to signs used in the etymologies, will be found on the back cover-lining.

KEY TO PRONUNCIATION.

a as in fat, man, pang.
 ā as in fate, mane, dale.
 ā as in far, father, guard.
 ā as in fall, talk, naught.
 ā as in ask, fast, ant.
 ā as in fare, hair, bear.
 e as in met, pen, bless.
 ē as in mete, meet, meat.
 ē as in her, fern, heard.
 i as in pin, it, biscuit.
 ī as in pine, fight, file.
 o as in not, on, frog.
 ō as in note, poke, floor.
 ō as in move, spoon, room.
 ō as in nor, song, off.
 u as in tub, son, blood.
 ū as in mute, acute, few (also new, tube, duty: see Preface, pp. ix, x).

ū as in pull, book, could.
 ū German ū, French u.
 oi as in oil, joint, boy.
 ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

ā as in prelate, courage, captain.
 ē as in ablegate, episcopal.
 ō as in abrogate, eulogy, democrat.
 ū as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that,

even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short u-sound (of but, pun, etc.). See Preface, p. xi. Thus:

ā as in errant, republican.
 ē as in prudent, difference.
 i as in charity, density.
 ō as in valor, actor, idiot.
 ū as in Persia, peninsula.
 ū as in the book.
 ū as in nature, feature.

A mark (˘) under the consonants t, d, z indicates that they in like manner are variable to ch, j, sh, zh. Thus:

ā as in nature, adventure.
 ē as in arduous, education.
 ē as in leisure.
 ē as in seizure.

th as in thin.
 th as in then.
 ch as in German ach, Scotch loch.
 n French nasalizing n, as in ton, en.
 ly (in French words) French liquid (mouillé) l.
 ' denotes a primary, " a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

< read from; i. e., derived from.
 > read whence; i. e., from which is derived.
 + read and; i. e., compounded with, or with suffix.
 = read cognate with; i. e., etymologically parallel with.
 √ read root.
 * read theoretical or alleged; i. e., theoretically assumed, or asserted but unverified, form.
 † read obsolete.

SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus:

back¹ (bak), n. The posterior part, etc.
 back¹ (bak), a. Lying or being behind, etc.
 back¹ (bak), v. To furnish with a back, etc.
 back¹ (bak), adv. Behind, etc.
 back² (bak), n. The earlier form of bat².
 back³ (bak), n. A large flat-bottomed boat, etc.

Various abbreviations have been used in the credits to the quotations, as "No." for number, "st." for stanza, "p." for page, "l." for line, ¶ for paragraph, "fol." for folio. The method used in indicating the subdivisions of books will be understood by reference to the following plan:

Section only § 5.
 Chapter only xiv.

Canto only	xiv.
Book only	iii.
Book and chapter	
Part and chapter	
Book and line	
Book and page	iii. 10.
Act and scene	
Chapter and verse	
No. and page	
Volume and page	II. 34.
Volume and chapter	IV. iv.
Part, book, and chapter	II. iv. 12.
Part, canto, and stanza	II. iv. 12.
Chapter and section or ¶	vii. § or ¶ 3.
Volume, part, and section or ¶	I. i. § or ¶ 6.
Book, chapter, and section or ¶	I. i. § or ¶ 6.

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discriminated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.

The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [cap.] for "capital" and [l.c.] for "lower-case" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoological and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoology, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoological and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers.

M represents a labial nasal sound, the corresponding nasal to *b* and *p*, as *n* to *d* and *t*, and *ng* to *g* and *k*. That is to say, in its production the lips are pressed together, or form a mute closure, as in *p* and *b*, and the vocal chords are set in sonant vibration, as in *b*; but the passage from the pharynx into the nose is open, so that the tone rings in the nasal as well as in the oral cavity, and this gives the peculiar quality which we term nasal. (See *nasal*.) Since the nose is incapable of complete closure (except by external means, as the fingers), the sound thus produced is resonant and continuous, and hence *m* and *n* are ordinarily reckoned as semivocal, or liquid, or the like. But *m* does not win, like *n*, an actual vowel value in English syllabification; though in vulgar pronunciation words like *dim*, *spasm*, etc., are sometimes resolved into *di-um*, *spas-um*, etc. The sound *m*, especially as initial, is a very stable element in Indo-European language-history: compare *man*, *mind*, Latin *mens*, Greek *μενος*, Sanskrit *man*, or *mother*, oldest traceable form *matar* (compared with the altered *father*, *brother*, oldest *pitar*, *bhratar*). *M* has no varieties of pronunciation, and is silent only in a few foreign words, as *mnemonic*; it is doubled under the same circumstances as the consonants in general, as in *dimmer*, *dimming*, *dimmed*, etc., from *dim*.

2. As a numeral, in the Roman system, *M* denotes 1,000. With a dash or stroke over it (*M̄*), it stands for a thousand times a thousand, or 1,000,000.—3. As a symbol: (a) In the mnemonic words of logic (see *mood*), *m* indicates a transposition (metathesis) of the premises in the reduction. (b) Formerly, *M* was a brand impressed on one convicted of manslaughter and admitted to the benefit of clergy.—4. As an abbreviation: (a) In titles, *M.* stands for *Magister* or *Master*, as in *A. M.*; for *Medicine* or *Medicine*, as in *M. D.*; or for *Member*, as in *M. C.*, member of Congress, and *M. P.*, member of Parliament. (b) In *mech.*, *m.* stands for *mass*. (c) In dental formulae, in *zool.*, *m.* stands for molar, and *dm.* for deciduous molar. (d) In *math.*, *M* or *μ* stands for *modulus*; in *higher geom.*, *m* or *μ* for the degree of a curve. (e) In *astron.* and *metrol.*, *m.* stands for *minute* (of time), and for *meter*; *mm.* for *millimeter*; and *μ* for *micron* or *micromillimeter*. (f) In *musical notation*, *M.* stands for *mano* (main), *mezzo*, *metronome*, and in organ-music for *manual*. See *M. D.*, *M. M.*, *M. S.* (g) In a ship's log-book, *m.* is an abbreviation of *mist*.—5. In *printing*, the square or quadrate of any body of type: more commonly spelled out, *em* (which see).—To have an *M* under (or by) the girdle, to have the courtesy of addressing by the title *Mr.*, *Mrs.*, etc.; show due respect by using the titles *Mr.*, *Mrs.*, etc. (Colloq.)

Mis. The devil take you, Neverout! besides all small curses.
Lady A. Marry, come up! What, plain Neverout! me thinks you might have an *M* under your girdle, miss.
Swift, *Polite Conversation*, 1.

Maba (mä'bä), *n.* [NL. (J. R. Forster, 1776), the name of the plant in Tonga-Tabu.] A genus of dicotyledonous gamopetalous plants belonging to the natural order *Ebenaceae*, the ebony family, characterized by dioecious flowers, almost always three-parted, from three to an indefinite number of stamens, and three styles, sometimes united below. They are shrubs or trees, usually of very hard wood, with small entire leaves, and flowers either solitary or in cymes. Fifty-nine species are known, natives of the warm regions of the globe. The ebony-wood of Cochinchina and Coromandel is believed to be the product of a tree of this genus. *M. geminata* and *M. laurina*, called *Queensland ebony*, furnish, with other species of the region, desirable substitutes for ebony. *M. buxifolia* has been called *East Indian satinwood*. The genus is found in a fossil state in many Tertiary deposits, the fruiting calyx on its peduncle being all that is usually preserved. Eight species are thus known. They have been described under the name *Macrethia*, now regarded as a section of *Maba*. One of these fossil species occurs in Colorado.

Mac. [*Gael. mac* = *Ir. mac* = *W. map*, *mab*, also *ap*, *ab*, a son, = *Goth. magus*, a son: see *may*². Cf. *ap*.] An element, usually a conjoined prefix, in many Scotch and Irish names of Celtic origin, cognate with the Welsh *Ap*, signifying 'son,' and being thus equivalent to the Irish *O'*, the English *-son* or *-s*, and the Norman *Fitz*-. The prefix is either written in full, *Mac*, or abbreviated to *Mc* or *M'*, which in works printed in the British Isles almost invariably appears as *M'*—the contracted form being followed by a capital letter, while *Mac* takes a capital after it but rarely. Thus a name may be variously spelled as *Macdonald* (rarely *MacDonald*), *M'Donald*, or *McDonald*; so *MacKenzie*, *M'Kenzie*, or *McKenzie*, etc. In catalogues, directories, etc., names with this prefix, whether written *Mac*, *M'*, or *Mc*, are properly entered in the alphabetical place of *Mac*-. Sometimes used separately for persons whose names begin with this prefix.

The *Fitzes* sometimes permitted themselves to speak with scorn of the *O's* and *Macs*, and the *O's* and *Macs* sometimes repaid that scorn with aversion. *Macaulay*.

Macaberesque (ma-kä-bér-esk'), *a.* [*Macabere* (see def.) + *-esque*. Cf. *ML. See *dance of death*, under *dance*.

Cuvier) (*Maca*, Lacépède, 1801), < *F. macaque* (Buffon), from a native name, *macaco*: see *macaco*².] A genus of Old World catarrhine monkeys of the family *Cercopithecidae* or *Cynopithecidae*; the macaques. The genus formerly included monkeys between the doucs (*Semnopithecinae*) and the baboons or drills (*Cynopithecinae*). It was next restricted to species inhabiting the East Indies, having cheek-pouches, ischial callosities, and a fifth tubercle on the back molar, such as the wanderoo (*M. silenus*), the bonnet-macaque (*M. sinicus*), the rhesus monkey (*M. rhesus*), the common toque (*M. cynomolgus*), etc. It is now restricted to species resembling the last-named. The leading genera which have been dissociated from *Macacus* are *Cercocebus*, *Inuus*, *Theropithecus*, *Cynopithecus*, and *Cercopithecus*.

(F. von Müller, 1857), named after one *Mac Adam*.] A genus of dicotyledonous apetalous plants belonging to the natural order *Proteaceae* and the tribe *Grevilleae*, characterized by having two pendulous ovules, seeds with unequal and fleshy cotyledons, anthers on short filaments inserted a little below the laminae, and a ring-like four-lobed or four-parted disk. There are two species, found only in eastern Australia. They are tall shrubs or trees with whorled leaves, either entire or serrate, and flowers pedicellate in pairs, in terminal or axillary racemes, the pedicels not connate. *M. ternstrofia* is the Queensland nut-tree, a small tree with dense foliage, a firm, fine-grained wood, and an edible nut with the taste of hazel, an inch or more in diameter.

macadamization (mak-ad'am-i-zä'shon), *n.* [*Macadamize* + *-ation*.] The process of laying carriage-roads according to the system of John Loudon Macadam, a Scottish engineer (1756-1836), who carried it out very extensively in England. In the common process, the top soil of the roadway is removed to the depth of 14 inches. Coarse cracked stone is then laid in to a depth of 7 inches, and the interstices and surface-depressions are filled with fine cracked stones. Over these as a bed is placed a layer 7 inches deep of road-metal or broken stone, of which no piece is larger than 2½ inches in diameter. This is rolled down with heavy steam- or horse-rollers, and the top is finished with stone crushed to dust and rolled smooth. Also spelled *macadamisation*.

The term has undergone the same restriction of meaning as *Macacus*; and most of the macaques, in a former sense of the word, have received special names. The Javan macaque, *M. cynomolgus*, with beetling brows and tail about as long as the body, is a fair example of the arboreal forms. The munga, *M. sinicus* of India, is known as the bonnet-macaque, from the top-knot which parts in the middle. The bunder, or rhesus macaque, *M. rhesus*, is a very common Indian species. The bruh, or pig-tailed macaque, *M. nemestrinus*, is a long-limbed form inhabiting the Philippines, with the tail of moderate length. In the Borneo black

macaque, *M. maurus*, the tail is a mere stump. Some of these monkeys reach the snow-line in Tibet, as *M. thibetanus*. A remarkable species, the wanderoo, *M. silenus*, with a tufted tail and the face set in an enormous frill of long gray hair, inhabits Malabar. Sometimes spelled *macaques*.

Macaria (mā-kā'ri-ā), *n.* [NL., < Gr. *μακάριος*, *makap*, blessed, happy.] In *zool.*, a name of various genera. (a) A genus of spiders. Koch, 1796. (b) The typical genus of *Macariidae* or *Macariinae*, erected by Curtis in 1826. They are delicate, slender-bodied moths of grayish color, whose larvae are slender with heart-shaped head. It is a large and wide-spread genus, occurring abundantly in Europe and America. *M. liturata* is the tawny-barred angle of English collectors, to whom *M. notata* is known as the small peacock-moth. (c) A genus of ladybirds or coccinellids, confined to South America, having the third and fifth joints of the antennae very small. Also *Macaria*. Dejean, 1834.

The word *macarize* has been adopted by Oxford men who are familiar with Aristotle, to supply a word wanting in our language. "Felicitate" and "congratulate" are (in actual usage) confined to events. . . . It may be said that men are admired for what they are, commended for what they do, and *macarized* for what they have.

Whately, On Bacon's Essay on Praise (ed. 1887).

macaroni (mak-ā-rō'ni), *n. and a.* [Formerly also *macaroni*, *mackeroni*, *macheroni*; = *F. macaroni* = *Sp. macarrones* = *Pg. macarrão*, < OIt. *macaroni*, It. *maccheroni*, *macaroni*, orig. a mixture of flour, cheese, and butter, prob. < *mac-care*, bruise, batter, < *L. macerare*, macerate; see *macerate*. Cf. *macaroon*, from the same source. In ref. to the secondary uses of the word (cf. It. *maccarone*, now *maccherone*, a fool, blockhead), it is to be noted that it is common to name a droll fellow, regarded as typical of his country, after some favorite article of food, as *E. Jack-pudding*, *G. Hanswurst* ('Jack Sausage'), *F. Jean Farine* ('Jack Flour').] 1. *n.* 1. A kind of paste or dough prepared, originally and chiefly in Italy, from the glutinous granular flour of hard varieties of wheat, pressed into long tubes or pipes through the perforated bottom of a vessel furnished with mandrels, and afterward dried in the sun or by low heat. The same material, called *Italian paste*, is also made into a thread-like product called *vermicelli*, and into sticks, lozenges, disks, ribbons, etc. Macaroni, cooked in various ways, constitutes a leading article of food in Italy, especially in Naples and Genoa, and it is much used elsewhere. Imitations of it are made in other countries from ordinary flour, which is much less suitable.

In lit., using, or characterized by the use of, many strange, distorted, or foreign words or forms, with little regard to syntax, yet with sufficient analogy to common words and constructions to be or seem intelligible: as, a *macaronic* poet; *macaronic* verse. Specifically, *macaronic* verse or poetry is a kind of burlesque verse in which words of another language are mingled with Latin words, or are made to figure with Latin terminations and in Latin constructions. The term was brought into vogue by the popular satirical works in this style of the Mantuan Teofilo Folengo (died 1544). It is probable that this use of the word has reference to the varied ingredients which enter into the preparation of a dish of macaroni.

A *macaronic* stage seems very often to mark the decline of an old literature and language, in countries exposed to powerful foreign influences.

In medieval arch., an opening in the vault of a portal or passage, or in the floor of a projecting gallery, made for the purpose of hurling missiles, or pouring down molten lead, hot pitch, etc., upon an enemy essaying to enter or mine. In the gallery type machicolations are formed by setting out the parapet or breastwork, B, supported on corbels; beyond the face of the wall, G, spaces between the corbels are left open, and constitute the machicolations. (See cut on following page.) Machicolations of permanent construction in stone were not introduced until toward the end of the twelfth century; but in the hoarding of wood with which walls and towers were crowned in time of need from the earliest period of the middle ages, their use was constant.

II. intrans. To lay plots or schemes.

machine (ma-shēn'), *n.* [= *D. machine* = *G. maschine* = *Dan. maskine* = *Sw. maskin*, < *F. machine* = *Sp. máquina* = *Pg. maquina*, *machina* = *It. macchina* = *Turk. makina*, < *L. machina*, a machine, engine, contrivance, device, stratagem, trick, < *Gr. μηχανή*, a machine, engine, contrivance, device; cf. *μηχανος*, means. Perhaps akin to *AS. macian*, *E. make*: see *make*¹. Cf. *mechanic*, etc.] 1. An engine; an instrument of force. With inward arms the dire *machine* (wooden horse) they load. *Dryden, Æneid, ii. 25.*

2. In *mech.*, in general, any instrument for the conversion of motion. Thus, a machine may be designed to change rapid motion into slow motion, as a crowbar; or it may be intended to convert a reciprocating rectilinear motion into a uniform circular motion, etc. The lever, the wedge, the wheel and axle, the pulley, the screw, and the inclined plane are termed the *simple machines*. In practical mechanics the word has a restricted meaning: a single device, as a hammer, chisel, crowbar, or saw, or a very simple combination of moving parts, as tongs, shears, pinchers, etc., for manual use, although comprised in the strict technical definition of *machine*, is always called a *tool* (which see): a device for applying or converting natural molar motion, like that of falling water, or of winds (as a water-wheel or windmill), or for converting molecular motion into molar motion (as a steam-engine, gas-engine, air-engine, or electric engine), is more generally,

though not uniformly, called a *motor*. The distinction between the words *tool* and *machine* becomes quite indefinite with increased complication of parts. Such machines as are used in shaping materials in the construction of the parts of other machines, and many of those which perform work, such as sawing, boring, planing, riveting, etc., formerly done only by hand and still performed manually to a greater or less extent, are variously called *machines*, *machine-tools*, *engine-tools*, or simply *tools*, although their structure may involve much complexity; the terms *machine-tool* and *engine-tool* are more frequently employed, the latter being preferable as being more in accord with best usage. Machines receive general or special names from the work they perform or are designed to execute, either with reference to departments of the arts or of industry, as *agricultural machines*, *hydraulic machines*, *wood-working machines*, etc., or to their specific work, as *planting-machines*, *sawing-machines*, *moving-machines*, etc.

This science will define a *machine* to be, not, as usual, an instrument by means of which we may change the direction and intensity of a given force, but an instrument by means of which we may change the direction and velocity of a given motion. *Ampère, tr. by Willis.*

3. A vehicle or conveyance, such as a coach, cab, gig, tricycle, bicycle, etc. [*Great Britain.*]

A pair of bootkins will set out to-morrow morning in the *machine* that goes from the Queen's Head in the Gray's Inn Lane. *Walpole, Letters, IV. 12. (Davies.)*

He had taken a seat in the Portsmouth *machine*, and proposed to go to the Isle of Wight. *Thackeray, Virginiana, lxii.*

4. A fire-engine. [*Colloq., U. S.*].—5. In the ancient theater, one of a number of contrivances in use for indicating a change of scene, as a rotating prism with different conventional scenery painted on its three sides, or a device for expressing a descent to the infernal regions, as the "Charonian steps," for representing the passage of a god through the air across the stage (whence the dictum *deus ex machina*, applied to the mock supernatural or providential), etc. Such machines were very numerous in the fully developed Greek theater, and were copied in the Roman.

Juno and Iris descend in different *Machines*: Juno in a Chariot drawn by Peacocks; Iris on a Rainbow. *Congreve, Semele, ii. 1.*

6. A literary contrivance for the working out of a plot; a supernatural agency, or artificial action, introduced into a poem or tale; machinery. [*Archaic.*]

7. Any organization by which power not mechanical is applied and made effective; the whole complex system by which any organization or institution is carried on: as, the vital *machine*; the *machine* of government.

Thine evermore, most dear lady, whilst this *machine* is to him, HAMLET. *Shak., Hamlet, ii. 2. 124.*

8. A strict organization of the working members of a political party, which enables its managers, through the distribution

of offices, careful local supervision, and systematic correspondence, to maintain control of conventions and elections, and to secure a predominating influence in the party for themselves and their associates for their own ends; also, the body of managers of such an organization. [*U. S.*].—**Atwood's machine**, an apparatus for illustrating uniformly accelerated motion, consisting of a pulley-wheel turning with very slight friction in a vertical plane and carrying a cord with equal weights suspended from its ends. In the common experiment there is an excess of weight at one end of the cord, due to a plate which rests on the weight and is caught when the latter passes through a fixed ring; the weight is set free from a state of rest at a measured position above this ring, so that the acceleration takes place through a known distance; and the velocity per second after the removal of the excess of weight is observed to be proportional to the square root of the distance through which the acceleration takes place. The machine is named from its inventor, George Atwood (1746–1807), an English mathematician.—**Bulldog machine**, combined sounding- and dredging-machine invented during the voyage of H. M. S. *Bulldog* in 1890, under the command of Sir Francis Leopold McClintock. It is an adaptation of Sir John Ross's deep-sea clam, with the addition of Brooke's principle of the disengaging weight. The chief credit of the invention is given to Mr. Steil, assistant engineer on board the *Bulldog*.—**Centrifugal machine**. See

centrifugal.—**Duck machine**, in Cornwall, a kind of ventilating-machine on the same principle as the ordinary blowing-engine, furnished with a piston and valves, and usually worked by the pump-rod. Also called *Hartz blower*.

See the adjectives.—**Extemporizing-machine**. See *extemporize*.—**Holts machine**. See *electric machine*, under *electric*.—**Hungarian, hydro-electric, infernal, etc., machine**. See the adjectives.—**Logical machine**, a machine which, being fed with premises, produces the necessary conclusions from them. The earliest instrument of this kind was the demonstrator of Charles, third Earl Stanhope; the most perfect is that of Professor Allan Marquand, which gives all inferences turning upon the logical relations of classes. The value of logical machines seems to lie in their showing how far reasoning is a mechanical process, and how far it calls for acts of observation. Calculating-machines are specialized logical machines.—**Reduced inertia of a machine**, according to Rankine, the weight which, concentrated at the driving-point, would have the same energy as the machine itself.—**To run with the machine**, to accompany a fire-engine to a fire, either as a member of the fire-company or as a hanger-on: a phrase used when the members of fire-companies (in large cities) were volunteers, and service at fires was gratuitous. [*U. S.*]

machine-gun (ma-shēn'gun), *n.* A gun which, by means of a variously contrived mechanism, delivers a continuous fire of projectiles. Such a gun may have a single barrel, or a series of barrels arranged horizontally or about a central axis. Machine-guns may be divided into two classes: those firing small-arm ammunition (also called *mitrailleuses*), and those firing shot and shell (called *revolving cannon*). The rapidity of fire of the most rapid machine-guns of the first class is about 1,000 shots a minute. (See *Gatling gun*, under *gun*.)

Maxim Field-gun, with bullet-proof shield.

The *Maxim gun* is a single-barreled machine-gun invented by Hiram Maxim, an American. In it the force of recoil is utilized to load and prepare the next charge for firing, and a water-chamber surrounding the machinery keeps the parts cool. It is a very ingenious and efficient invention. The *Lowell battery-gun* has four barrels capable of being rotated by a lever, independently of the lock and breech-mechanism. The firing is confined to one barrel at a time, until this becomes heated or disabled, when it may be rotated to one side in order to bring another barrel into action. One lock only is used. The *Taylor machine-gun*

Two-barreled Gardner Gun on Tripod.

has five parallel barrels arranged horizontally. The *Gardner machine-gun* has two to five barrels arranged horizontally. Its mechanism is simple, strong, and effective, but it can fire only about 350 shots a minute. The *Farwell machine-gun* consists of a group of ten steel barrels of 0.45 inch bore, each barrel having its own magazine, containing 50 cartridges. The operations of firing, extracting the empty shells, and reloading are accomplished by a single revolution of a crank. The *Hatchette revolving cannon* is the type of the second class of machine-guns. It combines the advantages of long-range shell-firing with rapidity of action. It has five barrels arranged around a central axis; and the breech is fixed and contains the loading-, firing-, and extracting-mechanism. The rotation is intermittent, and the loading, firing, and extraction of the empty shell are performed while the barrels are at rest. This gun fires from 30 to 80 rounds of explosive shells in a minute, thus delivering from 750 to 2,000 fragments of shell with sufficient force to destroy life. There are many forms of this gun, each designed for a special object. One form, designed for flank defense of the ditches of fortifications, has every barrel rifled with a different twist, so arranged as to produce five different cones of dispersion, thus sweeping the ditch from end to end. The *Nordenflett machine-gun* was designed as a defense against torpedo-boats. It is made with 2, 3, 4, 5, 7, 10, or 12 barrels, and it can fire either volleys or single barrels. In case a barrel becomes clogged or disabled, the supply of cartridges can be cut off from it and the firing continued with the other barrels.

Mackerel (*Scomber scombrus*).

North Atlantic on both sides. It attains a length of 18 inches, though usually less; it is lustrous dark-blue above, with many wavy blackish cross-streaks, and is silvery below, with the base of the pectorals dark. The *Raster*, *tinker*, or *chub mackerel* is a closely related species, *S. pneumatophorus*, so called from possessing a small air-bladder which is lacking in *S. scombrus*; it is found in both the Atlantic and Pacific oceans. The big-eyed, bull, or *colly mackerel* is *S. colias*, a variety of the last, locally named *Spanish mackerel* in England. The *Spanish mackerel* of the United States is a scombrid of a different genus, *Scomberomorus maculatus*, of both coasts of North America, north to Cape Cod and California. It is one of the most valued food-fishes, reaching a considerable size, bluish and silvery above, with bright reflections, the sides with many rounded bronzed spots, the spinous dorsal fin white at base, dark above and anteriorly. Other mackerel of this genus are the *cero*, *S. regalis*, and the *sierra*, *S. caballa*. *Frigate-mackerels* are scombrids of the genus *Auzia*, as *A. thazard* or *A. rochet*, of less value as food-fish. The *thorn-mackerel* properly so called is the *tunny*, *Oreomus thynnus*, the largest of the scombrids, sometimes attaining a length of over 10 feet and a weight of half a ton, found on both sides of the Atlantic; but this name is extended to various other fishes. (See *horse-mackerel*.) Several carangoid fishes are loosely called *mackerel*, as the yellow mackerel, *Caranx chrysops*. (See *mackerel-scad*.) The bluefish or skipper, *Pomatomus saltatrix*, is sometimes called *mapping-mackerel*.

Mackerel, on account of its perishable nature, was allowed to be sold on Sunday, as Gay notes: "Ev'n Sundays are prophand by *Mackrell* cries."

1. Branches of Madder (*Rubia tinctorum*) with flowers and fruits.
2. The rhizome. a, a flower; b, the pistil; c, two different fruits.

par. < E. *madder*. Cf. Skt. *madhura*, the name of several plants, < *madhura*, sweet, tender, < *madhu*, sweet: see *mead*.] 1. A plant of the genus *Rubia*, natural order *Rubiaceae*, yielding a valuable dyestuff of the same name. The ordinary dyers' madder is *R. tinctorum*, native of the Mediterranean region, a climbing, herbaceous, or at the base somewhat shrubby plant, with whorls of dark-green leaves and panicles of small yellowish 4-5-merous flowers, and with long succulent perennial roots. It was formerly esteemed as an emmenagogue and diuretic. *R. cordifolia*, of India, eastern Asia, and parts of Africa, affords garancin, and is used for the same purposes as European madder; it forms the madder of India, the Bengal madder or munjeet. *R. perigrina* is the proper wild madder of England, found throughout western and southern Europe. 2. A dyestuff and pigment obtained from the roots of *Rubia tinctorum* and other plants of the same family. It yields colors of the greatest permanence, and is employed in dyeing linen and cotton red. Two kinds are fixed upon cotton: one is called *madder-red*, and the other, which possesses a much higher degree of luster and fixity, is called *Adrianople red*, because it is largely exported from that city, or *Turkey red*, from the fact that for a long time it was mainly obtained from the Levant; it is also produced near Leghorn and Trieste. In the trade this madder bears the name of *alkazari* or *hazari*. The roots are broken up by means of wooden stampers, which reduce the bark and splint-bark to powder, leaving the hard inner part unbroken; but the whole root is sometimes pulverized. The coloring principle of madder is termed *alizarin*. Madder contains also a red pigment, *purpurin* or *rubiacin*, which is extracted in the form of orange-colored prismatic crystals, and yields a good dye, either alone or in combination with alizarin. Through the peculiar chemical affinity of phosphate of lime for its coloring matter, madder is noted for its remarkable physiological effect of turning red the bones of animals to which it is fed, as well as the claws and beaks of birds. — *Brown madder*, a lake prepared from madder-root, having a rich brown color of great depth. — *Capucine madder*. See *capucine*. — *Flowers of madder*, the trade-name for a preparation made by steeping pulverized madder, causing the sugar it contains to ferment, then washing the residue, pressing out the water, drying, and pulverizing it again. It is used for dyeing purposes in the same manner as ordinary madder. Also called *refined madder* and *madder-bloom*. — *Indian madder*. (a) *Rubia cordifolia*. (b) *Olanlandia umbellata*. (c) Some species of the genus *Hedyotis*. — *Madder-brown*. See *brown*. — *Madder-carmin*, a pigment made by precipitating the coloring matter of the madder-root upon a base of alumina. — *Madder color*, a pigment derived from madder or its compounds. Madder colors range from brown, through yellow, rose, and red, to deep purple, and are much used in dyeing and the fine arts. — *Madder lakes* (pink madder, rose madder, madder lake, purple madder, brown madder, Rubens's madder, madder-yellow, madder-orange), lakes prepared from madder varying in shade from pink through red and yellow to purple and brown. These are also known as *rubric lakes*. — *Madder-red*. See *def. 2*. — *Madder style*, a method of calico-printing in which the parts of the cloth which are to receive a madder color are printed with a mordant, washed and rinsed in a solution of alum and size, and then drawn through a colored solution which becomes fixed where the mordant has been applied, after which the dye is washed off the unmordanted parts of the cloth. Also called *chintz style*, *garancin style*. — *Petty madder*, a plant of the genus *Crucifera*, of the Mediterranean region. Also called *crosswort*. — *Refined madder*. Same as *flowers of madder*. — *Wild madder*. (a) *Rubia perigrina*. (b) The white bedstraw, *Galium Mollugo*.

In true madrepore the animal or polypite is hexamerous with twelve short tentacles, and the polypidom is of branching form and stony hardness. Madrepore coral consists of carbonate of lime, with traces of animal matter, and is formed by gradual deposition in the tissues of the compound polyp, so that in course of time the whole presents the appearance of a number of polyps supported on an extraneous body. When the animal matter has been removed madrepore is of a white color, wrinkled on the surface, and full of little cavities, in each of which an individual polyp was lodged, the radiating septa of the cavities corresponding to the internal divisions of the animal. The allusion in the def. is to the "woman in the city, which was a sinner," mentioned in Luke vii. 37-50, and, as in the heading of that chapter, traditionally identified (esp. since the 5th century, and in the Western Church, contrary to the tradition of the Eastern Church) with Mary Magdalene as mentioned (in another connection) in the next chapter,

"Mary called Magdalene, out of whom went seven devils" (Luke viii. 2). This identification was doubtless assisted by a confusion of the three anointings, one by "a woman in the city" (Luke vii. 37, as above), one by "a woman," also unnamed, in Bethany (Mat. xxvi. 7 and Mark xiv. 3), and the third by "Mary," the sister of Martha and Lazarus, also in Bethany (John xi. 2 and xii. 3). to Sir J. F. W. Herschel, "They are, generally speaking, round, and somewhat oval, and the larger, which deviates most from the circular form, exhibits the appearance of an axis of light, very ill-defined, and by no means strongly distinguished from the general mass. . . . The greater nebula occupies an area of about 42 square degrees. The lesser covers about 10 square degrees. Their degree

of brightness may be judged of by the effect of strong moonlight, which totally obliterates the lesser, but not quite the greater." Though they resemble parts of the Galaxy to the naked eye, their telescopic appearance is in marked contrast, owing to the great numbers of clusters and nebulae which they contain.

Thus, the noun is orig. from the adj.; but in Eng. it precedes it.] I. *n.* 1. Any supposed supernatural art; especially, the pretended art of controlling the actions of spiritual or superhuman beings. Belief in such an art exists among all primitive races, and was prevalent in medieval Europe. The practice of magic has embraced, in a great variety of ways, the cure of disease, the forecasting of events, and the gratification of desires otherwise unattainable. It has been everywhere, with the rise and earlier progress of literature, formulated into more or less elaborate systems. All kinds of divination, judicial astrology, and to a large extent alchemy were outgrowths of it.

But though his *magik* for a wyke or tweye,
It seemed that alle the rokkes were aweye.
Chaucer, *Franklin's Tale*, l. 567.

If she in chains of *magic* were not bound.
Shak., *Othello*, I. 2. 65.

The word *magic* is still used, as in the ancient world, to include a confused mass of beliefs and practices, hardly agreeing except in being beyond those ordinary actions of cause and effect which men accustomed to their regularity have come to regard as merely natural.

Encyc. Brit., XV. 199.

2. Power or influence similar to that of enchantment: as, the *magic* of love.

He [Arnold] has a power of vision as great as Tennyson's, though its *magic* depends less on the rich tints of association, and more on the liquid colours of pure natural beauty.

(b) Control of natural forces through the knowledge of their laws.

Was not Persian Magic a reduction or correspondence of the principles and architectures of nature to the rules and policy of governments? . . . And here I will make a request that I may revise and reintegrate the misapplied and abused name of *Natural Magic*; which in the true sense is but Natural Wisdom or Natural Prudence; taken according to the ancient acception, purged from vanity and superstition.
Bacon, *Advancement of Learning*.

Superstitions or goetic magic consists in the invocation of devils or demons, and supposes some tacit or express covenant or agreement with them. — *White magic*, practice of magic either quite innocent or at least not involving a compact with the devil.

Magic circle, a modification of the magic square as devised by Franklin, consisting of eight concentric circles equally divided by eight radii, in the sections of which all the numbers from 13 to 75 are so arranged that the sum of the numbers in each circle, together with 12 entered at the center, is equal to 360, and that the sum of the numbers in each radial column, together with the central 12, is also equal to 360. As reconstructed by Dr. Barnard, the numbers from 1 to 64 are taken, and are so arranged that the constant sum of both concentric and radial ranks, added to 100 entered at the center, is 360. — **Magic cube**, an extension of the arrangement of an arithmetical series in a magic square or parallelepipedon to all sides of a hexagon, so that the sum of the numbers in each lineal rank of numbers, parallel to the edges of the cube or the diagonals upon all faces, is constant. In a perfect magic cube every term enters into thirteen distinct equalities. — **Magic cylinder**, a modification of a perfect magic cube or parallelepipedon when one of its surfaces is transferred to a cylinder having a circumference equal to the edge of the cube, and the vertical squares are arranged in equidistant radii: such a magic cylinder will have either no number at the axis, or the same number in the center of every one of the five parallel planes. — **Magic lantern**. See *lantern*, and cut under *stereopticon*. — **Magic music**. See *music*. — **Magic sphere**, a modification of a magic cube or parallelepipedon when its surface is transferred to a sphere, and the several vertical columns are arranged in equidistant radii. — **Magic square**, a square figure

formed by a series of numbers in mathematical proportion, so disposed in parallel and equal ranks that the sum of each row or line taken perpendicularly, horizontally, or diagonally is constant. Magic squares are also formed

magisterial (maj-is-tē-ri-al), *a.* [*< L. magisterium*, the office of a chief, president, master, director, teacher, etc. (see *magistry*), + *-al*.]

1. Of or pertaining to a master; such as befits a master; authoritative; hence, lofty; arrogant; imperious; domineering.

Those who have fairly and truly examin'd, and are thereby got past doubt in all the doctrines they profess and govern themselves by, . . . are so few in number, and find so little reason to be *magisterial* in their opinions, that nothing insolent and imperious is to be expected from them.
Locke, *Human Understanding*, IV. xvi. 4.

Authoritative**, *Magisterial*, *Dogmatic*, *Arrogant*, *Domineering*, *Imperious*, *Dictatorial*, *Peremptory*, official, grand, haughty, lordly, oracular. *Authoritative* is rarely used in a bad sense. *Magisterial*, in the sense of having the manner of a master or magistrate, generally indicates the overdoing of that manner: as, *magisterial* pomp and gravity. *Dogmatic* reaches somewhat more deeply into the character; the *dogmatic* man insists strenuously upon the correctness of his own opinions, and, being unable to see how others can fail to believe with him, *dictatorially* presses upon them his opinions as true without argument, while he tends also to blame and overbear those who venture to express dissent. (See *confident*.) *Arrogant* implies the assumption of more than due authority from an overestimate of one's importance. (See *arrogance*.) *Domineering*, *imperious*, and *dictatorial* apply to the assertion of one's own will over those of others in the attempt to rule. *Domineering* suggests unfittedness or lack of authority to rule, with an insulting, hectoring, or bullying manner. *Imperious* contains most of the real power of the will, suggesting a lofty or lordly determination to be obeyed. *Dictatorial* implies, on the one hand, a disposition to rule, and, on the other, a sharp insistence upon having one's orders accepted or carried out. *Peremptory* shuts out discussion: a *peremptory* command or denial is one that must be obeyed or accepted to the letter and without debate; it is positive, absolute, and often immediate.

2. In *alchemy*, a *magisterium* or *magistral*; in *chem.*, one of various extracts or preparations, especially *magisterium bismuthi*, a precipitate formed when water is added to a solution of bismuth in nitric acid. See the quotations from Boyle and Boerhaave.

He that hath had Water turned to Ashes hath the *Magistry*, and the true Philosopher's Stone.
Howell, Letters, I. vi. 41.

Although *majestery* be a term variously enough employed by chemists, and particularly used by Paracelsus to signify very different things, yet the best notion I know of it . . . is, that it is a preparation whereby there is not an analysis made of the body assigned, nor an extraction of this or that principle, but the whole or very near the whole body, by the help of some additament, greater or less, is turned into a body of another kind.
Boyle, Works, I. 637.

Magistries seem to have been thus called by the ancient chemists as denoting the capital production or masterpiece of their art. They pretend that they are able to take any simple body, and without any change of its weight, or division of its parts, alter it into another exceedingly different from the former, and usually liquid: for instance, to reduce an ounce of gold into a fluid of the same weight, by fire alone, without the addition of any other matter.
Boerhaave, Chemistry (tr. by Shaw, 3d ed., 1753), I. 171.

The term *magma* is also frequently used to designate molten or plastic material lying beneath the surface, which it is desirable to speak of, without any specific indication of its mineral character, in discussing the phenomena of volcanism, metamorphism, etc.

Carrying out this idea still further, he (Durocher) propounded the theory that beneath the earth's solid crust there exist two *magmas*, the upper consisting of light acid materials, the lower of heavy basic ones; and he supposes that by the varying intensity of the volcanic forces we may have sometimes one or the other *magma* erupted and sometimes varying mixtures of the two.

an important part of numerous meteorites. The pure magnesium carbonate (magnesite) occurs in various localities, but is by no means an abundant mineral. The non-silicated soluble compounds of magnesia are also of rather rare occurrence in nature, but are found in considerable quantity in a few localities, among which that in the vicinity of Stassfurt in Prussia is economically of by far the greatest importance. The combinations found there are kainite, carnallite, and kieserite. (See these words.) Both magnesium sulphate and magnesium chloride occur in the water of many mineral springs as well as in that of the ocean. The bones of animals and the seeds of various cereals contain a small amount of magnesium phosphate, and the salt is also found in guano. Magnesian salts are used to a limited extent in medicine, especially the sulphate (Epsom salt); they are also used in dressing cotton goods and in dyeing; but, on the whole, the economical importance of the combinations of magnesium, considering their abundance and the cheapness with which they could be furnished in large quantity, is exceedingly small.

magnet (mag'net), *n.* [ME. *magnete* = D. *magnet* = MHG. *magnes*, *magnēte*, G. *magnet* = Dan. Sw. *magnet* = OF. *magnete*, *manete* (the mod. F. term is *aimant*: see *adamant*, *aymant*) = Sp. Pg. It. *magnete*, < L. *magnes* (*magnet-*) (with or without *lapis*, stone), a magnet, < Gr. *μάγνης*, also *μάγνησσα*, prop. adj., *Μάγνης*, *Μαγνήτις*, *Μαγνησία*, *Μάγνησσα* (sc. *λίθος*), a magnet, lit. stone of Magnesia, < *Μάγνης* (*Μαγνήτις*), also *Μαγνήτις*, an inhabitant of Magnesia, < *Μαγνησία*, *Magnesia*, a district in Thessaly, where the magnet or magnetic iron ore appar. first came to notice.] A body which possesses the property of attracting fragments of iron or steel, and which, when freely suspended, tends, under the action of the earth, to take a certain definite position, pointing approximately north and south. The lodestone, a variety of the mineral magnetite, or the native magnetic oxid of iron (Fe₃O₄), is a natural magnet; but the properties of the magnet are best shown by an artificial magnet (see below), which has commonly the form of a straight bar or that of a horseshoe. When a bar-magnet is dipped into iron filings, it is found that they adhere most strongly at the extremities of the bar (which are called the *poles* of the magnet), and not at all along the line midway between them. Strictly speaking, however, except in the case of a long thin magnet, the poles are not exactly at the ends. The middle line is called the *neutral line* or *equator* of the magnet; the straight line joining the poles is the *axis* of the magnet, or *magnetic axis*. A magnetic bar may abnormally have one or more intermediate points of maximum attraction, which are then

Steel Magnet with consequent poles at *a* and *b*.

called *consequent poles*. Again, if a magnetic needle is suspended at its center of gravity so as to be entirely free to turn, it is found that in general it places itself with its axis in a direction nearly north and south, and with one end inclining downward. The pole which is directed toward the north is called the *north* or *north-seeking pole*, also the *boreal*, *positive*, or *red pole*, or *marked end* of the needle; the other, the *south*, *south-seeking*, *austral*, *negative*, or *blue pole*, or *unmarked end*. It is found, further, that the like poles of two magnets repel and unlike poles attract each other. If a magnet is broken into halves, each half is found to be a complete magnet with a north and a south pole; and this is true no matter how often the process of division is repeated. On this and other more fundamental grounds, it is concluded that the magnetic polarity belongs to each molecule throughout the bar, and the maximum attraction observed near the ends is only the resultant effect of all these individual forces. (See *magnetism*.) A *magnetic substance* is one which may be attracted by a magnet, but has not the property of attracting other magnetic substances, and therefore has no polarity. Soft iron is a magnetic substance, as is also most magnetite, the lodestone variety being exceptional. A *permanent magnet* is one which retains its magnetism after the magnetizing influences (see below) cease to act. Steel and the lodestone have this property, on account of their high degree of coercive force. (See *coercive*.) Soft iron has very little coercive force, and accordingly its power of retaining magnetism is small. An *artificial magnet* (as a compass-needle) is made by contact with other magnets, and the methods employed are described as *single-touch*, *double-touch*, and *separate-touch*, according to the way in which the substance to be magnetized is rubbed by the magnets. Such a magnet may also be made by magnetic induction without actual contact. (See *induction*, 6.) Again, a magnet may be made by passing a current of electricity through a wire wound about the bar to be magnetized; this is called an *electromagnet* (which see). By this means magnets of very great strength may be made. They have usually a horseshoe form, and the bar is of soft iron, so that it retains its magnetism only so long as the current is passing. The earth may be considered as a huge magnet, whose poles

are situated in the neighborhood of the geographical poles, though not coinciding with them; the north magnetic pole of the earth corresponds in polarity to the south-seeking pole of a magnetic needle. The action of the earth causes a freely suspended needle to set in a plane called the *magnetic meridian*, which in general makes an angle east or west of the geographical meridian (see *declination*), and with one pole (in the northern hemisphere, the north-seeking pole) inclined downward (see *dip of the needle*, under *dip*). The earth's magnetic force also serves to induce magnetism in masses of iron lying in or near the magnetic meridian. An iron ship is thus magnetized in the course of its construction. Similarly, iron columns, etc., are often found to be feebly magnetic. Magnetic properties belong also to some other compounds of iron besides the magnetic oxid, as pyrrhotite or magnetic pyrites (Fe₇S₈), and to some varieties of the native sesquioxid, hematite (Fe₂O₃); also to the magnetic metals nickel, cobalt, chromium, and manganese. Some varieties of platinum are strongly magnetic, and occasionally masses have polarity also, but this may be due to the large percentage of iron present, although all so-called iron-platinum does not show this property. Finally, it is found that a powerful electromagnet exerts an effect on all substances, in accordance with which they are divided into the two groups *paramagnetic* and *diamagnetic* (this is explained under *diamagnetism*). — **Compound magnet**. Same as *magnetic battery*. — **Deflecting-magnet**. A magnet used for deflecting a magnetic needle: often attached to a galvanometer for the purpose of fixing the zero of the needle in a certain position, or for altering the sensitiveness of the needle by changing the magnetic field. Also called *zero magnet*, *directing-magnet*, and *deflector*. — **Horseshoe magnet**. A magnet having a form somewhat resembling a horseshoe (see figure), being bent so that the two poles are brought near together, and hence can act at the same time upon the keeper or armature. A horseshoe electromagnet commonly consists of two bobbins side by side, whose cores are connected at one end by a piece of soft iron. — **Moment of a magnet**. See *moment*. — **Permanent magnet**. See the definition. — **Portative force of a magnet**, the maximum weight which a magnet can support. — **Receiving-magnet**. Same as *relay-magnet*. — **Relay-magnet**, or *relay*, in *telep.*, a sensitive electromagnetic receiving instrument used to close a circuit in the receiving station, which contains a battery and a less sensitive receiving instrument, such as a sounder or a register: also used to retransmit a message over another section of the line. See *transmission*. — **Saturated magnet**. See *magnetism*. — **Solenoidal magnet**, a long and thin bar-magnet, uniformly magnetized, whose poles are at or very near the ends. In such a magnet the distribution of the magnetism is said to be solenoidal, in distinction from the lamellar distribution of a magnetic shell (which see, under *magnetic*). — **To arm a magnet**. See *arm*. — **To make the magnet**. See *make*.

field, the space through which the force or influence of a magnet is exerted; also, the space about a conductor carrying an electric current in which, as it may be shown, magnetic force is also exerted. Compare *magnetic shell* (below) and *magnetism*.—**Magnetic fluid**, a hypothetical fluid the existence of which was assumed in order to explain the phenomena of magnetism.—**Magnetic force**, the force exerted between two magnets, or, more definitely, between two magnetic poles. It is repulsive between like and attractive between unlike poles, and varies in intensity with the product of their strengths directly, and with the square of the distance between them inversely.—**Magnetic guard**. See *guard*.—**Magnetic induction**, the power which a magnet or a current of electricity possesses of exciting temporary or permanent magnetism in such bodies in its vicinity as are capable of receiving it. See *induction*, *induct*.—**Magnetic-induction capacity**. Same as *magnetic permeability*.—**Magnetic intensity**. For iron this is the temperature of bright-red heat; for cobalt it is above that of white heat; for nickel it is about 350° C.—**Magnetic magazine**. Same as *magnetic battery*.—**Magnetic matter**, an imaginary substance possessing magnetic properties, the distribution of which in a magnet is conceived by Sir William Thomson to represent magnetic polarity.

It will very often be convenient to refer the phenomena of magnetic force to attractions or repulsions mutually exerted between portions of an imaginary *magnetic matter*, which, as we shall see, may be conceived to represent the polarity of a magnet of any kind.

Magnetic meridian, *moment*, etc. See the nouns.—**Magnetic needle**, any small magnetized iron or steel rod turning on a pivot, such as the needle of the mariners' compass.—**Magnetic north**, that point of the horizon which is indicated by the direction of the magnetic needle. It is seldom the true north. See *magnetic meridian*.—**Magnetic observatory**, a station provided with apparatus for making both absolute and differential determinations of the elements of the earth's magnetism, and at which systematic observations are maintained. The instruments used for absolute measures are the magnetometer for the declination and horizontal force, and the dip-circle for the inclination. The instruments used for differential measures are the declinometer, which shows the changes in the declination, and magnetometers, which register the variations in the horizontal and vertical components of the force. By the application of photography a continuous registration of these variations is obtained.—**Magnetic permeability**. See *permeability*.—**Magnetic points of convergence**, the magnetic poles of the earth, around which are drawn the isogonic lines, or lines of equal declination.—**Magnetic poles of the earth**, two nearly opposite points on the earth's surface, where the dip of the needle is 90°. They are at a considerable distance from the geographical poles of the earth.—**Magnetic potential**. See *potential*.—**Magnetic pyrites**, a bronze-yellow magnet iron sulphid, varying in composition from Fe_2S_3 to $Fe_{10}S_{11}$. Also called *pyrrhotite*.—**Magnetic resistance** or *reluctance*. See the nouns.—**Magnetic retentiveness**. Same as *coercive force*.—**Magnetic rotation of currents**, the dynamical effects, observed under suitable conditions, produced by a magnet in rotating a conductor carrying a current, or conversely of a stationary conductor traversed by a current in rotating a magnet.—**Magnetic rotatory power**, the rotation of the plane of polarization of a ray of light passing through a transparent medium in a powerful magnetic field. According to the direction of rotation, it is designated as + or -. Verdet's constant for a given substance is the amount of rotation between two points whose difference of magnetic potential is 1 c. g. s. unit. See *polarization*.—**Magnetic scale**, a table or diagram exhibiting the paramagnetic and diamagnetic metals in the order of their strengths.—**Magnetic screen**, a soft iron shell—for example, in the form of a sphere—which, if of the proper thickness, cuts off a magnetic needle within from the effect of a magnet without. Such a screen is sometimes used to free a needle from the earth's force, so that it can obey the impulse of a current sent about it.—**Magnetic sense**, a supposed special sense by which magnetic influences are perceived.

Magnetic separator, an apparatus or instrument for separating iron from other substances, as iron from brass filings, or scraps of nails or wire from wheat. *E. H. Knight*.—**Magnetic shell**, a magnet in the form of a very thin plate or sheet, the surfaces of which have opposite polarity. A thin slice of a cylindrical bar-magnet would be a magnetic shell; or, in other words, a bar-magnet may be thought of as made up of a great number of magnetic shells placed together with their poles facing in the same direction. A closed electric circuit—for example, a circular wire traversed by a current—is equivalent to a magnetic shell; and a series of such circuits, or practically a solenoid, has all the properties of a bar-magnet, and is surrounded by a similar field of force.—**Magnetic storm**, an abrupt disturbance of the equilibrium of the magnetic forces controlling a freely suspended magnetic needle, which is thereby thrown into rapid oscillation and displaced from its mean position; usually observed simultaneously over a considerable portion of the earth, and hence inferred by some to be of cosmic origin. Magnetic storms are often accompanied by electrical earth-currents, observed, for example, as a disturbing element in connection with telegraph-lines. They are most frequent during those periods (at intervals of about eleven years) when auroras are common, and both phenomena accompany the time of sun-spot frequency.—**Magnetic substance**. See *magnet*.—**Magnetic susceptibility**. See *susceptibility*.—**Magnetic telegraph**, the electric telegraph. See *telegraph*.—**Magnetic tick**, a faint metallic sound produced when an iron bar is rapidly magnetized or demagnetized.

When an iron or cobalt bar is magnetized it becomes longer and somewhat more slender, but does not appreciably alter in volume; it also emits a slight sound—a *magnetic tick*.

That peculiar property occasionally possessed by certain bodies (more especially by iron and steel) whereby, under certain circumstances, they naturally attract or repel one another according to determinate laws. According to the molecular theory of magnetism, the molecules of a magnetic substance possess permanent polarity, and as it is more and more highly magnetized the poles are arranged more and more perfectly in a common direction; when it is magnetized to the highest degree possible—that is, to saturation—all the north poles of the molecules point in one direction and all the south poles in the opposite direction. On this theory coercive force is simply that condition of the substance which retards this molecular arrangement during the process of magnetization and tends to retain it after magnetization. The current theory, or Ampère's theory of magnetism, supposes each molecule to be traversed by a closed electric circuit; these currents become parallel upon magnetization, and may then be regarded as equivalent to a series of closed electric currents about the exterior of the bar, these currents being clockwise at the south pole and counter-clockwise at the north pole. This theory derives its support from the observed fact that a spiral conductor traversed by a current (a solenoid) behaves as a magnet in all respects, being directed similarly by the earth and having a similar field of force about it. See *magnet*.

In many treatises it is the fashion to speak of a magnetic fluid or fluids; it is, however, absolutely certain that *magnetism* is not a fluid. . . . A fluid cannot possibly propagate itself indefinitely without loss.

Magnifying power of a microscope, the ratio of the length upon the retina of any part of the image of the object looked at with the microscope to the length of the retinal image of the same object looked at without the microscope at a standard distance of 10 inches. It is always equal to the focal length of the object-glass divided by that of the eyepiece. For a distant object the focal length of the object-glass is that for parallel rays—that is, its principal focal length; for nearer objects the focal length is greater, and the magnifying power is correspondingly increased.

We commonly find in the ambitious man a superiority of parts, in some measure proportioned to the *magnitude* of his designs.

Horley, *Works*, I. iv.

2. Largeness of relation or significance; importance; consequence: as, in affairs of *magnitude* disdain not to take counsel.—3. Size, or the property of having size; the extended quantity of a line, surface, or solid; length, area, or volume.

And fast by, hanging in a golden chain,
This pendent world, in bigness as a star
Of smallest *magnitude*. *Milton*, *P. L.*, II. 1053.

One may learn how the feeling of *magnitude* varies with changes in the absolute *magnitude* of the object, and so reach a more precise and scientific statement of this particular aspect of the coexistence between body and mind.

J. Sully, *Sensation and Intuition*, p. 44.

4. Any kind of continuous quantity which is comparable with extended quantity. In this sense we speak of the *magnitude* of a velocity, force, acceleration, or other vector quantity; but we do not properly speak of a *magnitude* of heat, energy, temperature, sound, etc. The use of the word as a synonym of *quantity*, as in the following passage, is to be deprecated.

By intensive *magnitude* is meant the strength of a sensation; by extensive *magnitude*, its volume, which roughly speaking corresponds to the area of the sentient surface and the number of nervous elements acted upon.

J. Sully, *Sensation and Intuition*, p. 44.

5. In *astron.*, the brightness of a star expressed according to the numerical system used by astronomers for that purpose. In this sense *magnitude* translates Greek *μεγεθος*, used in the same sense in the *Almagest*, the expression being due to the fact that bright stars, by an effect of irradiation, look larger than faint ones. The brightest stars are said to be of the first *magnitude*, while those of the sixth *magnitude* are hardly noticed by casual observers in ordinary states of the sky. Since the brightness of stars has been measured photometrically, the interval between successive *magnitudes* has been defined by a constant ratio of brightness, which in the so-called absolute scale, now generally used, is $\sqrt[5]{100}$, or 2.51.

6. In *anc. pros.*, the length of a syllable, foot, colon, or meter, expressed in terms of the metrical unit (primary time, semeion, or mora): as, a foot of trisemic *magnitude*; a colon of icosasemic *magnitude*.—**Absolute magnitude**. See *absolute*.—**Angular magnitude**, the quantity of an angle.—**Apparent magnitude of an object**, that *magnitude* which is measured by the optic or visual angle intercepted between lines drawn from the extreme points of the object to the center of the pupil of the eye. This angle may be considered to be inversely as the distance of the object. [This phrase is used chiefly with reference to the heavenly bodies, but is employed also in many branches of optical science, with the same general meaning.]—**Center of magnitude**. See *center*.—*Syn. Bull.*, Volume, etc. See *size*.

magnoferrite (mag-nō-fer'it), *n.* See *magnesian-ferrite*.

Magnolia (mag-nō'li-ā), *n.* [NL. (Plumier, 1703), named after Pierre Magnol, a French botanist (1638-1715).] 1. A genus of plants, type of the natural order *Magnoliaceae* and the tribe *Magnolieae*, characterized by a sessile cone-shaped cluster of pistils, and two-ovuled persistent carpels which open down the back at maturity. They are trees or shrubs with entire alternate leaves, often evergreen, conduplicate in the bud, and then protected by membranous stipules, and large showy flowers which are solitary and terminal. The calyx consists of three deciduous sepals, and the corolla of six to twelve petals, usually white or purplish; and the stamens and pistils are numerous. The flowers are generally fragrant, and the fruit is a spike, consisting of a number of follicles, from the openings of which the scarlet or brown seeds are suspended at maturity by long and slender threads. There are about 15

species, indigenous to subtropical Asia and the eastern part of North America. They are almost all very ornamental and are frequently cultivated. *M. conspicua* is the yulan. *M. grandiflora* is the big laurel or bull-bay of the southern United States, a fine forest-tree, 60 or 80 feet high, evergreen, with fragrant flowers. *M. macrophylla* is the great-leaved cucumber, a less common tree of the same region. *M. umbellata* is the umbrella-tree. *M. acuminata*, the cucumber-tree or mountain-magnolia, extends north to New York and Ohio. Another cucumber-tree is *M. cordata*, growing in the Southern States. *M. glauca*, a moderate-sized tree, or northward a shrub, grows in swamps from Massachusetts to Florida and Texas. It has globular fragrant flowers, 2 inches long, the leaves ever-

green in the south. It is variously named *small* or *laurel magnolia*, *sweet-bay* or *white-bay*, *white laurel* or *swamp-laurel*; also *beaver-tree* and *swamp-sassafras*. The genus appears very early and very abundantly in the fossil state, over 50 species having been described. They range from the Middle Cretaceous to the Pliocene, being more numerous in the Cretaceous than in the Tertiary in both Europe and America, and also occurring in Greenland, in Australia, in Japan, and in Java.

The bird is from 15 to 20 inches long, according to the development of the tail, which is 12 inches or less in length, extremely graduated; the stretch of wings is about 2 feet. Magpies are omnivorous, like most corvine and garruline birds, and noted for their craftiness, kleptomania, and mimicry. They nest in trees and shrubs, building a very

Magpie (*Pica caudata*).

bulky structure, and lay from 6 to 9 pale-drab eggs, dotted, dashed, and blotched with brown. As a book-name, *magpie* is extended to all the species of *Pica* and some few related pies or jays with long tails. The yellow-billed *magpie* of California is *P. nuttalli*. Blue magpies are certain long-tailed jays of the genus *Cyanopollus*, as *C. cyanus* of eastern Asia and Japan, or *C. cooki* of Spain; also of the genus *Urocissa*, as *U. erythrorhyncha*, the red-billed blue magpie of the Orient. The bird called *French magpie* is the red-backed shrike, *Lanius collurio*. The name *magpie*, or *magpie-pigeon*, is given to a strain of domestic pigeons bred to colors resembling those of the magpie. *Magpie* is often used adjectively with reference to some characteristic of the bird.

2. The magpie-shrike.

Below us in the Valley a mob of Jackasses were shouting and laughing uproariously, and a magpie was chanting his noble vesper hymn from a lofty tree. *H. Kingsley, Geoffrey Hamlyn*, p. 167.

One of the members of the learned and priestly caste in ancient Persia, who had official charge of the sacred rites, practised interpretation of dreams, professed supernatural arts, and were distinguished by peculiarities of dress and insignia. Their origin may be traced to the Accadians, a Turanian race, the earliest settlers of the lower Euphrates valley. The first historical reference to the Magi occurs in Jer. xxxix. 8, 13, where a Babylonian rab-mag, or chief of the Magi, is mentioned in connection with the siege, capture, and rule of Jerusalem.

2. In Christian history, one of the "wise men" who, according to the Gospel of Matthew (ii. 1, 2), came from the East to Jerusalem to do homage to the new-born King of the Jews. A tradition as old as the second century (resting on Pa. lxix. 10; Isa. xlix. 7) makes them kings, and at a later period the names Melchior, Kaspar, and Balthasar become attached to them. As the first of the pagans to whom the birth of the Messiah was announced, they are honored at the feast of Epiphany; in the calendar, however, the three days immediately following the first of the new year are called after them. In works of art the youngest of them is represented as a Moor.

Mahabharata (ma-hā-bhā'ra-tā), *n.* [Skt., *< mahā-, great, + Bhārata, a descendant of a king or a tribe named Bharata, < √ bhar = Gr. φέρειν = E. bear¹.*] The name of one of the two great epic poems of ancient India, the other being the *Ramayana*. It contains a history of the contest for supremacy between the two great royal families of northern India, the Pandavas and the Kūrus or

Kauravas, ending in the victory of the former and the establishment of their rule. In reality, this narrative occupies but a fourth of the poem, the other three fourths being episodic and added at various times. The Mahabharata thus became a sort of encyclopedia, embracing everything that it concerned a cultivated Hindu to know.

'the guided or directed one,' < mā-, a formative prefix, + hādī, guide (> hādī, a guide in religion, spiritual director, hidāya, guidance).*] According to Mohammedan belief, a spiritual and temporal ruler destined to appear on earth during the last days. Some sects hold that the Mahdi has appeared, and in concealment awaits the time of his manifestation. There have been a number of pretended Mahdis, of whom the latest of importance was the chief whose armed followers resisted the advance of the British troops into the Sudan in 1884-85, and overthrew the Egyptian power in that region, which they continued to hold. The belief apparently grew out of the Jewish belief in the coming of the Messiah.

It is from the descendants of 'Alee that the more devout Moslems expect the *Mahdee*, who is to reappear on earth in company with the Prophet Elias, on the second coming of Christ. *J. P. Brown, The Dervishes*, p. 74.

Mahdi, or 'the well-guided,' is the name given by the Shi'ites to that member of the family of 'Ali who, according to their belief, is one day to gain possession of the whole world, and set up the reign of righteousness in it. *Encyc. Brit.*, XVI. 570.

The Shi'ites in general hold this view. Also *Mahdist*.

Mahdism (mā'di-izm), *n.* [*< Mahdi + -ism.*] The doctrine of, or belief in, the coming of the Mahdi.

I pass on to consider the influence which an intensely bigoted religious enthusiasm has exercised and still exercises over the Soudan negro. The strength of *Mahdism* lies in this feeling. *Fortnightly Rev.* XLIII. 701.

Mahdism (mā'dizm), *n.* [*< Mahdi + -ism.*] Same as *Mahdism*.

In '83, when his book begins, *Mahdism* had become a fact. *The Academy*, Oct. 20, 1883, p. 249.

The inner bark has been much used for cordage.—2. *Sterculia Caribaea*, a tall West Indian tree.—3. *Melicope ramiflora*, a small New Zealand tree of the violet family, with small flowers in bundles on the branches.—Blue, gray, or mountain mahoe, *Hibiscus (Paritium) elatus*, a West Indian tree yielding the Cuba bark.—Congo mahoe, *Hibiscus clypeatus*.—Seaside mahoe, *Thespesia populnea*, also one of the *Malvaceae*, whose bark has been used in British Guiana for making coffee-sacks.

Flowering Branch of Mahogany (*Swietenia Mahogani*).
a, the flower; *b*, the fruit.

Swietenia Mahogani, of the natural order *Meliceae*. It is native in the West Indies, Central America, Mexico, and the Florida keys. Its importance lies in its timber.

2. The wood of the above tree. It combines a rich reddish-brown color, beauty of grain, and susceptibility of polish with unusual soundness, uniformity, freedom from warping, durability, and largeness of dimensions. On account of its costliness, its use is restricted mainly to furniture-making, cabinet-work, etc., often in the form of a veneer. The quality of the timber varies with the conditions of its growth, exposed situations and solid ground yielding the finest. Mahogany with figured grain is especially prized, and is obtained largely, but not exclusively, from the San Domingo and Cuba wood, called *Spanish mahogany*. The Honduras mahogany, or baywood, shipped from the Bay of Campeachy, is more open-grained and plain, and of larger dimensions, yielding logs sometimes 40 feet in length. The Mexican mahogany has the largest growth of all, is similar to the last-named, and supplements its diminishing supply.

It was the favorite armor in Europe during the twelfth and thirteenth centuries, but was slow of fabrication and expensive. It was of three kinds: (1) that in which the rings kept their shape by their stiffness alone, and which was therefore very heavy; (2) that in which the links were riveted and forged; (3) that in which each link was braced across by a small bar—a rare form. See *hauberk*, *chausses*, *banded mail* (under *banded*), *gusset*, and *camail*.

that of the middle ages and the sixteenth century, made in Majorca or in Spain, or more especially in Italy, in supposed imitation of ware from the two former countries.

2. As applied to modern pottery, a kind of ware which in effects of color partly imitates the pottery above defined, especially in large pieces used for architectural decoration, garden-seats, vases, etc. This ware is usually much harder and more perfectly manufactured than the ancient, but is inferior in decorative effect, being cast in molds and having a mechanical look.—*Fontana majolica*, a variety of the majolica of Urbino, the name *Fontana* having been adopted by certain of the leading decorators of that school. The painter known as *Orazio Fontana* is the most celebrated of these; his work takes rank among the finest productions of the sixteenth century.

Greater; more important or effective; first in force or consideration; leading; principal: as, the major premise or term of a syllogism.

My major vow lies here; this I'll obey.
Shak., T. and C., v. 1. 49.

2. Greater in quantity, number, or extent: as, the major part of the revenue, of an assembly, or of a territory.

Lanier, Science of Eng. Verse, p. 241.

3†. Of age; having attained to majority. *Godwin*.—4. In music: (*a*) Of intervals, standard or normal; literally "greater," as compared with minor intervals. The term is more often applied to seconds, thirds, sixths, sevenths, and ninths, designating an interval equivalent to the intervals between the key-note of a standard or normal scale and its second, third, sixth, seventh, and ninth tone respectively. Thus, a major second is two semitones long, a major third four semitones, a major sixth nine semitones, and a major seventh eleven semitones. *Major* has also been applied of late to fourths, fifths, and octaves, and is then equivalent to the older term *perfect*. Finally, it is used to distinguish the larger of two intervals that differ by a minute quantity: as, a major step or tone (♯), which is a comma greater than a minor tone. Opposed to *minor*, and also often to *diminished* and *augmented*. See *interval*, 5. (*b*) Of tones, distant by a major interval from a given tone: as, A is the major third of F, etc. (*c*) Of tonalities and scales, standard or normal: characterized by a major third and also by a major sixth and seventh: opposed to *minor*. The major tonality or scale is the recognized standard of reference for all the modern musical systems. See *key*, *tonality*, and *scale*. (*d*) Of triads and chords, characterized by a major third between the root and the tone next above, and a perfect fifth between the root and the second tone above: opposed to *minor*, *diminished*, and *augmented*. The major triad is the usual standard of reference in classifying the chords of modern music. See *triad* and *chord*. (*e*) Of cadences, ending in a major triad. (*f*) Of modes in the modern sense, and thus of composition in general, characterized by the use of a major tonality and of major cadences: as, a piece is written throughout in the major mode. From an acoustical point of view, major intervals, chords, and scales are simpler and stronger in themselves and admit of better harmonic extension and combination than minor. The educated taste of modern times has tended to exalt the major over the minor, making the former the standard and normal of which the latter is the variation; while the medieval systems, being based upon a different conception of music at various points, tended the other way. The esthetic effect of the major in contrast with the minor is brighter, stronger, and more complete. It has recently been maintained that major and minor phenomena, in all their phases, are mutually reciprocal, the major triad, scale, etc., being measured upward in a certain way from a given tone, and the minor triad, scale, etc., being measured downward in the same way from the same tone. According to this view, the major triad of C is called the *over-chord* of C, and the minor triad of F is called the *under-chord* of C, etc.

5. In logic, wider; broader; more extensive; a predicate to more subjects. The major extreme or major term of a syllogism is that term which enters into the predicate of the conclusion; the major premise is that premise which contains the major term. These have always been the usual definitions, but they have been subject to much dispute, owing to the fact that all real distinction between major and minor vanishes in certain cases.—*Bob major*. See *bob*, 7.—*Major axis*. Same as *transverse axis* (which see, under *axis*).—*Major function*. See *function*.

Air contaminated with some pathogenic substance from the soil; specifically, air impregnated with the poison producing intermittent and remittent fever.—2. The disease produced by the air thus poisoned. In a strict sense the word is a generic term designating intermittent and remittent fever and other affections, such as malarial neuralgia, due to the same cause. Malarial diseases in this sense prevail in all quarters of the globe except the coldest, and the infection of soil and air occurs in both uninhabited and populous regions. The disease is contracted by presence in the locality, and not from the sick, nor do the latter seem to transmit the infection to new places to which they may go. The disease may apparently be introduced into the body through water that is drunk as well as through the air. The development of the poison is favored by heat and moisture. Malarial diseases are apt to increase after the turning up of virgin soil. The poison seems to lie low in the atmosphere, but may be blown to adjacent heights. Besides the well-marked

fevers, the malarial poison produces various and often ill-marked perversions of the general health, such as neuralgia, neuritis, anemia, digestive disturbances, and albuminuria. The anatomical effects of the malarial poison are enlargement of the spleen, sometimes excessive, darkening of the skin, and the presence of a dark pigment in the blood, in amorphous masses. There is found, moreover, in malarial blood a variety of peculiar living bodies which are supposed to be the various stages in the life-history of a single organism. This has been called the *Plasmodium malariae*. All these forms of malaria are, as a rule, affected favorably by quinine, and to a less degree by certain other drugs, notably arsenic.

The two together contribute to the stability of the ankle-joint, by locking the astragalus so as to prevent lateral and rotatory movements. In man the outer malleolus is formed by the fibula, the inner by the tibia; and each forms a sort of pulley or trochlea around which wind the tendons of important extensor muscles of the foot. The malleoli are little distinguished in most animals, owing to the different set of the foot upon the leg, or the different configuration of the parts. When, as often occurs, the fibula does not reach the ankle, the outer malleolus is wanting unless formed by the tibia. In birds the condyles of the tibia, constituted by ankylosis of proximal tarsal bones, take the name and place of malleoli.

2. In bot., a layer; a shoot bent into the ground and half divided at the bend, whence it emits roots. *Lindley*.—3. [*cap.*] In *conch.*, a genus of bivalve shells. *J. E. malleus (mal'ē-us), *n.*; *pl. mallei* (-ī). [NL., *< L. malleus*, a hammer, a mall: see *mail*.] 1. In anat., the proximal element of Meckel's car-

tilage, in any way distinguished from the rest of the mandibular arch. In man and other mammals the malleus is separately ossified, and is the outer one of the three bonelets or ossicles of the ear lodged in the cavity of the tympanum, connected with the ear-drum or tympanic membrane, and movably articulated with the incus. It is named from its hammer-like shape in man, having a head, neck, and handle or short process, together with a processus gracilis, which lies in the Glaserian fissure. As one of the ossicula auditiva, the malleus subserves the function of hearing in mammals. In birds, and many other vertebrates below mammals, the malleus has a very different office, that of forming part of the suspensorium of the lower jaw, which is its true morphological character. Its specialization in *Mammalia* is peculiar to that class. See *Malleifera*, and cuts under *hyoid*, *ear*, and *tympanic*.

2. In *ichth.*, one of the Weberian ossicles which form a chain between the air-bladder and the auditory apparatus in the skull of plectospondylous and nematognathous fishes. It is homologous with the hemapophysis of the third one of the coalesced anterior vertebrae.—3. In rotifers, one of the paired calcareous structures within the pharynx. In the typical forms it is a hammer-like body, consisting of an upper part or head, called the *incus*, and a lower part or handle, named the *manubrium*, but in other forms the distinction disappears.

4. [*cap.*] In *conch.*, a genus of pearl-oysters of the family *Aviculidae*, founded by Lamarck in 1799; the hammer-shells. They have a long-winged hinge at right angles with the length of the valve, giving a hammer-like shape, whence the name. Young shells are like those of *Avicula* or wing-shells, and have a byssal notch; the hammer shape is gradually acquired with age. *M. vulgaris*, the hammer-oyster, inhabits Eastern seas. They differ from true lice in having mandibulate instead of suctorial mouth-parts, and in other respects. Most of them live on the plumage of birds, whence the name *bird-lice* for the whole of them; but some also infest the pelage of mammals. Some are great pests of the poultry-yard and aviary. Earth containing a considerable quantity of chalk in fine particles; a calcareous loam, constituting in the southeastern counties of England a soil especially suited for the growth of hops; a kind of earth suitable for making the best quality of brick without any addition. See *malm brick*, below.

To the north-west, north, and east of the village (of Selborne) is a range of fair enclosures, consisting of what is called a white malm, a sort of rotten or rubble stone, which, when turned up to the frost and rain, moulders to pieces, and becomes manure to itself.

2. [*cap.*] The name used in Germany, and frequently by geologists writing in English on the geology of that country, for the uppermost of the three divisions of the Jurassic series, all of which at an early day received English provincial names, namely *Lias*, *Dogger*, and *Malm*.

The Malm of the German geologists (which is not the equivalent of the English malm rock) corresponds paleontologically with the Middle and Upper Oolite of England. The rock consists mostly of white limestone, with dolomitic and marly strata, and is in some places over 1,000 feet thick.

These beds are known as freestone and *malm rock*, and there also occur smaller quantities of blue rag and chert. The freestone is a light-colored calcareous sandstone much used for building. The *malm rock* much resembles it, but is slightly more chalky-looking.

F. *malt* = Sp. Pg. It. *malto*, < Teut., < *meltan* (pret. *mealt*), melt, dissolve: see *mett.*] 1. Grain in which, by partial germination, arrested at the proper stage by heat, the starch is converted into saccharine matter (grape-sugar), the unfermented solution of the latter being the sweet-wort of the brewer. By the addition of hops, and the subsequent processes of cooling, fermentation, and clarification, the wort is converted into porter, ale, or beer. The alcoholic fermentation of the wort without the addition of hops, and distillation, yield crude whisky. Barley is the grain most used for malting in the manufacture of beer; but wheat, rye, and other grains are largely malted for whisky. Barley yields about 92 per cent. of its weight of dried malt.

malt¹ (mált), *v.* [*< malt¹, n.*] **I. trans.** To convert (grain) into malt. The steps in the process of malting are four: First, steeping in water for twenty-four to forty hours, by which the grain takes up from 10 to 30 per cent. of water, swells, and begins to germinate. Second, couching, in which the steeped grain is piled in heaps on a floor, usually made of flagstones, and wherein the growth of the rootlets is aided by heat generated in the mass. Third, flooring, in which the germinating grain is spread upon a floor in charges called *floors*, and stirred to expose it to air, and in which the growth of the rootlets is checked and the germination of the acrospires is carried to the desired limit. Fourth, drying, in which the germination is completely arrested by heat in a malt-kiln. The maltster decides, from the length and appearance of the acrospires as to when the conversion of the starch has been carried to the right limit. The dried acrospires and the rootlets are broken off by handling in the kiln, and are removed by sifting. The chemical changes effected by the partial germination and subsequent treatment of the grain are chiefly the conversion of the azotized substances into diastase, the conversion of the starch into grape-sugar by the action of the diastase, and the imparting of color and flavor to the malt in the kiln. The malt is either pale or dark in color, according to the degree of heat and the length of time it is exposed to heat in the kiln; and a peculiar flavor is derived from empyreumatic oil generated in the husk.

In this work he first made prominent the fact that population, unless hindered by positive checks, as wars, famines, etc., or by preventive checks, as social customs that prevent early marriage, tends to increase at a higher rate than the means of subsistence can, under the most favorable circumstances, be made to increase. As a remedy he advocated the principle that society should aim to diminish the sum of vice and misery, and check the growth of population, by the discouragement of early and improvident marriages, and by the practice of moral self-restraint.

mamma² (mam'ā), *n.* [*L. mamma* (> It. *mamma* = Sp. Pg. *mama*, *L.* dim. *mamilla*, > *F. mamelle* = AS. *mamme*) = Gr. *μάμη*, the breast, pap. See *mama*.] 1. Pl. *mammæ* (-ē). The mammary gland and associated structures; the characteristic organ of the class *Mammalia*, which in the female secretes milk for the nourishment of the young; a breast or udder. The *mamma* is essentially a conglomerate gland, consisting of lobes and lobules, secreting milk, which is conveyed from the ultimate ramifications of the organ by a system of converging lactiferous or galactophorous ducts, to be discharged through one or several main orifices at the summit of the gland, where is the nipple or *mamilla*. The *mamma* is subcutaneous, and may be regarded as a highly developed and specialized sebaceous follicle. *Mammæ* vary much in number and position: they may be 2, 4, 6, 8, to 12 or more, usually an even

Mambrino, 13th century

number, being paired, and may be pectoral, axillary, ventral or abdominal, or inguinal. They are sometimes quite high on the sides of the animal, but are never dorsal. An apparently single and median mamma, as the udder of the cow, results from the coalescence of as many mammas as there are teats. In marsupials they are contained in the pouch, and may be circularly or irregularly disposed, or of odd number. In monotremes they are devoid of a nipple, whence the name *Amast* for these animals. The mamma develops at puberty, and comes into functional activity during gestation. The structure is common to both sexes, but as a rule remains rudimentary and functionless in the male.

mammal (mam'al), a. and n. [= OF. *mammal* = Sp. *mamal* = Pg. *mamal*, *mammal* = It. *mammale*, n.; < NL. *mammale*, a mammal, neut. of LL. *mammalis*, of the breast, < L. *mamma*, the breast: see *mamma*².] I. a. Having breasts or teats; mammiferous.

II. n. An animal of the class *Mammalia*.—**Aerial mammals**, the bats.—**Age of mammals**, the Tertiary period in geology.

Mammalia (ma-mā'liā), n. pl. [NL. (sc. *animalia*), neut. pl. of LL. *mammalis* (neut. sing. as a noun, *mammale*), of the breast: see *mammal*.] In *zool.*, the highest class of *Vertebrata*, containing all those animals which suckle their young, and no others; mammiferous animals; the mammals. With the exception of the lowest subclass, the monotremes or *Ornithodelphia*, which lay eggs like birds, *Mammalia* are viviparous, bringing forth their young alive; and, with the same exception, the mammary gland is provided with a nipple for the young to suck. They have no gills, but breathe air by means of lungs, which are primitively an offset of the alimentary canal. The blood is warm; the heart is completely four-chambered or quadricocular, with two auricles and two ventricles; and its right and left sides are entirely separate after birth, when the arterial and venous circulation and the pulmonary and systemic vessels become differentiated. The heart and lungs are situated in the thoracic cavity, which is completely shut off from the abdomen by a muscular diaphragm. The aorta is single and sinistral, curving over the left bronchus. The blood contains red circular non-nucleated blood-disks and white blood-corpuscles. The brain has large cerebral hemispheres, which are more or less extensively united by commissures, especially by a corpus callosum, which when well developed roofs over more or less of the lateral ventricles. The skull has two occipital condyles and an ossified basioccipital. The lower jaw, composed of a pair of simple mandibular rami, is directly articulated by a convex condyle with the glenoid fossa of the squamosal. The malleus and incus become specialized auditory ossicles, lodged like the stapes in the cavity of the tympanum. (See *Malleifera*.) Limbs are always present. There are ordinarily two pairs, anterior and posterior, or pectoral and pelvic, but the latter are sometimes aborted, as in cetaceans and sirenians. The ankle-joint, if there is one, is always formed between crural and tarsal bones, and is never mediotarsal. The body is usually more or less hairy, sometimes naked, rarely scaly or with a bony exoskeleton. The class *Mammalia* is definitely circumscribed, no transitional forms being known. It has been subdivided in various ways. Linnaeus had 7 orders, *Primates*, *Bruta*, *Ferae*, *Glires*, *Pecora*, *Belluae*, and *Cete*, with 40 genera in all. Cuvier made the 9 orders *Bimana*, *Quadrumania*, *Carnaria*, *Marsupialia*, *Rodentia*, *Edentata*, *Pachydermata*, *Ruminantia*, and *Cetacea*. Owen divided *Mammalia* primarily into 4 subclasses, according to the character of the brain, and 14 orders, as follows: *Archencéphala*—*Bimana*; *Gyrencephala*—*Quadrumania*, *Carnivora*, *Artiodactyla*, *Perissodactyla*, *Proboscidea*, *Sirenia*, *Cetacea*; *Liencephala*—*Bruta*, *Chiroptera*, *Insectivora*, *Rodentia*; *Lyencephala*—*Marsupialia*, *Monotremata*. Dana's prime divisions correspond to Owen's by other names, *Archontia*, *Megasthena*, *Microsthenia*, and *Otiticoidea*. In 1872 Gill arranged mammals in 3 subclasses and 14 orders, as follows: subclass *Monodelphia*, containing all placental mammals, orders *Primates*, *Ferae*, *Ungulata*, *Toxodontia* (fossil), *Hyracidae*, *Proboscidea*, *Sirenia*, *Cete*; in one series *Educatilia*, and *Chiroptera*, *Insectivora*, *Glires*, *Bruta*, in a second series *Ineducabilia*; subclass *Didelphia*, the implantental mammals, order *Marsupialia* alone; subclass *Ornithodelphia*, the oviparous mammals, order *Monotremata* alone. This is substantially the classification now almost universally current, but it is exclusive of certain fossil groups which require ordinal rank. The families of mammals now recognized are about 150 in number, the genera nearly 1,000; the living species are about 3,250. Remains of mammals abound in all Tertiary deposits, and a few forms have been found in Mesozoic beds. Also called *Mammifera* and *Malleifera*.

mammoth (mam'oth), *n.* and *a.* [= *F. mam-mouth* = *Sp. mamut*, *mammath* = *G. mammut*, < *Russ. mamantū*, a mammoth, so called by a Russian named Ludloff in 1696, said to be < Tatar *mamma*, the earth, "because, the remains of these animals being found embedded in the earth, the natives [Yakuts and Tungusians] believed that they burrowed like moles" (*Imp. Dict.*).] 1. *n.* An extinct species of elephant, *Elephas primigenius*. It is nearly related to the existing Indian elephant, having teeth of similar pattern, and is believed to have been the ancestor of this species; but it was thickly covered with a shaggy coat of three kinds, long stiff bristles and long flexible hairs being mixed with a kind of wool. This warm covering enabled it to endure the rigor of winter in its native regions. The tusks were of great size and much curved. An entire mammoth was discovered in 1799 by a Tungusian fisherman named Schumachoff, embedded in the ice on the banks of the river Lena in Siberia, in such complete preservation that its flesh was eaten by dogs, wolves, and bears. It was about 9 feet high and 16 feet long, with tusks 9 feet long measured along the curve. In later years the bones and tusks of the mammoth have been found abundantly in Siberia, and the fossil ivory has been of great commercial value. This article had been known for many centuries before the discovery of the animal itself, and the mammoth is now supposed to have ranged, before, during, and after the glacial epoch, over the greater part of the northern hemisphere. That it was contemporary with prehistoric man is shown by the discovery of a drawing of the animal scratched on a piece of its own ivory found in a cave in France. This species is more expressly known as the hairy mammoth. The name *mammoth* is extended to other fossil elephants of the same genus or of the subfamily *Elephantinae*, but is not applicable to the mastodons, of the subfamily *Mastodontinae*.

[Also dial. *mon*; < *ME. man*, *mon*, pl. *men*, < *AS. man*, *mon*, *mann*, *monn* (pl. *men*, *menn*), also rarely *manna*, *monna* (pl. *mannan*, *monnan*) = *OS. man* = *OFries. man*, *mon* = *D. man* = *MLG. man*, *LG. mann* = *OHG. MHG. man*, *G. mann* = *Icel. madhr*, also rarely *manni* (in comp. *mann*; nom. orig. **manr*) = *Sw. man* = *Dan. mand* = *Goth. manna* (*mannan*, *mann*, *man*), a man (*L. vir*), a human being, a person (*L. homo*), in the latter use becoming in *AS. man*, *mon*, *ME. man*, *men*, *me* = *D. men* = *OHG. MHG. G. man* = *Sw. Dan. man* = *Goth. manna*, merely pronominal, 'one' (cf. *F. on*, 'one,' < *L. homo*, a man), esp. with a negative (*Goth. ni manna* = *G. niemand*, no one; *G. jemand*, any one); Teut. stem in three forms, *mann*, *mannan*, and *man*, as shown in *Goth.* and *Icel.* (the third form *man* existing in *Goth.* gen. sing. and nom. and acc. pl. *mans*, and prob. also in *Icel. man*, neut., a bondman, bondwoman, girl); the earlier *mann* being for **manu*, **manu* (cf. *chin*, < *AS. cin*, **cinn* = *Goth. kinnus* = *Gr. γένος*; *min*, ult. < **minu* = *Gr. μινος*) = *Skt. manu*, *man* (*Manu*, the mythical father of the human race (cf. *OTeut.* in *L. form Man-nus*, mentioned by Tacitus as a deity of the ancient Germans), with deriv. *manusha*, *man*. Cf. *OBulg. ma'zhi* (orig. **monzhi*) = *Bulg. mužh* = *Sloven. mōzh* = *Serv. Bohem. mužh* = *Pol. mužh* = *Little Russ. mužh* = *Russ. mužhū*, a man, husband (> *Russ. mužhikū*, a peasant). Not found in *Gr.*, nor in *L.*, unless it be = *L. mas* (*mar*), a male (if that stands for orig. **mans*), > ult. *E. male*, masculine, marital, marry, etc.: see these words. The ult. origin of the Teut. and *Skt.* word is unknown. It is usually explained as lit. 'the thinker,' < **man*, think (> ult. *E. mind*, *mean*, *L. men* (t-s), mind, > *E. mental*, etc.); but that primitive men should think of themselves as 'thinkers' is quite incredible: that is a comparatively modern conception. Another derivation, referring to *L. manere*, remain, dwell, is also improbable. It is not likely that any orig. significant term old enough to have become a general designation for 'man' before the Aryan dispersion would have retained its orig. significance. The *E. man* retains the senses of *L. vir* and *homo*; in *D. G. Dan.* the word cognate with *E. man* means *vir*, while a derivative, *D. G. mensch*, *Dan. menneske*, etc., means *homo*: see *mensch*, *mannish*. The irreg. pl. of *man* is due to original *t*-umlaut, the *AS. pl. men*, *menn*, being orig. **manni*, changed to **menni* by umlaut, and then abbr. to *menn*, *men* by loss of the final vowel, the radical vowel, thus accidentally changed in the plural, coming to be significant of number. A similar change appears in *feet*, *geese*, *mice*, etc., pl. of *foot*, *goose*, *mouse*, etc.] 1. In *zool.*, a featherless plantigrade biped mammal of the genus *Homo* (which see); *H. sapiens*, a species of the family *Hominidae* or *Anthropidae*, order *Primates*, class *Mammalia*, of which there are several geographical races or varieties. Blumenbach divided mankind into five varieties: (1) *Caucasian*, having a white skin; (2) *Mongolian*, having an olive skin; (3) *Ethiopian*, having a black skin and black eyes; (4) *American*, having a dark skin more or less of a red tint; (5) *Malay*, having a brown or tawny skin. Professor Huxley has divided man into five groups — *Australoid*, *Negroid*, *Mongoloid*, *Xanthochroic*, and *Melanochroic*; and there are many other divisions, on linguistic or physical grounds, or both, but none that has now general or wide acceptance.

The American manatee, to which the name was originally given, and to which it specially pertains, is *Manatus americanus*, *australis*, or *latirostris*, whether of one or two species. The manatee inhabits the shallow waters of rivers and estuaries on the eastern coast of tropical and subtropical America, from Florida and some of the West India islands to about lat. 90° S. The body is naked and stout, shaped like that of a fish, without trace of hind limbs, ending in an expansive shovel- or spoon-shaped tail; the fore limbs are flippers or paddles without outward distinction of digits, but with flattened nails; the eyes and ears are small; and the whole physiognomy is peculiar, owing to the tumidity and great mobility of the muzzle. The flowers grow in simple racemes, and have a funnel-shaped corolla, a calyx with five scales or an indefinite number of glands, and a disk which is five-parted or has five scales. They are tall climbing shrubs, with opposite feather-veined leaves, and simple racemes of yellow, white, or rarely violet flowers, which are usually large and showy. Webster, Duchess of Malfi, iv. 2.

2. [*cap.*] A genus of plants of the natural order *Solanaceae*, the nightshade family, and tribe *Atropeae*. The corolla is induplicate in the bud, the calyx is foliaceous and five-parted, and the pedicels are partially clustered among the radical leaves. They are herbs, nearly stemless, rising from a thick, fleshy, often forked root, and bear tufts of large, ovate, lance-shaped leaves, and quite large pale bluish-violet, white, or purple flowers, which are reticulately veined. Five species have been described (but these may be reducible to one), found throughout the Mediterranean region. The ordinary plant has been commonly known as *M. officinalis*, but this includes a spring and a fall kind sometimes separated as species, *M. vernalis* and *M. autumnalis*. The *mandragora* or *mandrake* has long been known in medicine, and has been the subject of much superstition. See *mandrake*.

mandrake (man'drāk), *n.* [*< ME.* *mandrake*, *mondrake*, *mandrake*; an alteration, appar. simulating *drake²*, of earlier ME. *mandrag*, *mandrage*, short for *mandragora*, q. v. To the

peculiar form of the root, and the suggestive form of the name *mandrake*, appar. a compound of *man* + *drake*², with little meaning attached to the supposed second element, are due in large part the superstitions associated with the plant.]

1. A plant of the genus *Mandragora*. The mandrake has poisonous properties, and acts as an emetic, purgative, and narcotic. It was in use in ancient times especially for its narcotic effects, and is said to have been employed as an anesthetic. It has been regarded as an aphrodisiac, and used in amorous incantations, as a love-amulet, etc. According to an old fancy the mandrake shrieks when pulled from the ground. The resemblance of its commonly forked root to the human body is probably the ground of this superstition, as well as of the reputed of the plant as an aphrodisiac.

Flowering Plant of Mandrake (*Mandragora officinalis*).

And Reuben went in the days of wheat harvest, and found mandrakes in the field, and brought them unto his mother Leah. Gen. xxx. 14.

And shrieks, like mandrakes torn out of the earth, That living mortals, hearing them, run mad. Shak., R. and J., iv. 3. 47.

The mandrake, a plant with broad leaves and bright yellow flowers and with a root which grew in a semi-human form, was found beneath the public gallows and was dragged from the ground and carried home with many extraordinary ceremonies. When secured, it became a familiar spirit speaking in oracles if properly consulted, and bringing good luck to the household in which it was enshrined. C. Elton, *Origins of Eng. Hist.*, p. 220.

The best digest of the various speculations as to the mandrake and its properties will be found in Dr. Harris's "Dictionary of the Natural History of the Bible." N. and Q., 7th ser., VIII. 220.

2. The May-apple, *Podophyllum peltatum*. [U.S.]

The blushing peach and glossy plum there lies, And with the mandrake tempts your hands and eyes. Jane Turrell, quoted in Tuckerman's *America and her Commentators*, p. 33.

3. In *her.*, a figure resembling a root with two long and pointed bifurcations usually twisted together, and the whole crowned with leaves and berries.

mandrel, **mandril** (man'drel, -dril), *n.* [An alteration of **mandrin*, < F. *mandrin*, a mandrel, former, strike, perhaps < L. *mandra*, a stall, < Gr. *μάδρα*, a stall, the bed in which the stone of a ring is set: see *madrigal*.] 1. In *mech.*, a cylindrical bar or spindle, either of uniform diameter, of different diameters, or tapered, used for a variety of purposes, but chiefly for the support of objects formed with holes, into which the mandrel is forcibly driven in order to hold them firmly while turning in a lathe, or in an analogous machine, or in operating upon them with a file. Specifically—(a) An axis attached to the head-stock of a lathe, to support, during the process of turning, any material which is bored or pierced with a central hole. It has often some adjustable device for securing it to the material, and is then known as an *adjustable mandrel*. (b) Any arbor or axis to support a tool, as a mandrel for a circular saw or circular cutter. (c) A rod or former for shaping forgings, or a plug-core for metal or glass castings.

2. A miners' pick. [Eng.]—3. In *metal-working* by the spinning process, the form, usually of wood, upon which the thin plate of metal or blank is pressed in order that the revolution may give it the form of the mandrel.—**Adjustable mandrel**. See def. 1 (a).—**Expanding mandrel**, a mandrel constructed to engage and firmly hold a piece of material on the inside of a hole of uniform diameter, for turning, etc. Such mandrels are of various construction. A common form is a central arbor having grooves with inclined-plane bottoms in which move simultaneously and equally tapered key-alides, the outer sides of which are always parallel with each other and with the axis of the arbor. When moved longitudinally, these slides expand against the inside of the hole with force, holding the piece by jamming friction.—**Flexible mandrel**, a spiral spring placed in a metal tube to prevent it from flattening or collapsing when bent.—**Hicks's mandrel**, an expanding mandrel for turning rings, named from its inventor. It is an arbor with a cone in the middle, in the periphery of which, at equal distances from each other, are formed longitudinal dovetailed grooves carrying wedge-shaped slides actuated simultaneously and equally by a nut on the end of the cone, and thus expanded to fit the bore of the ring to be turned.—**Traversing mandrel**. (a) A mandrel which moves longitudinally. (b) A mandrel fitted to a bearing or bearings of a support which may be set in the tool-post of the slide-rest of a lathe, or in some other traversing device. Such mandrels are used for expanding reamers and analogous tools, and they are usually driven by a pulley-and-belt mechanism.

mandrel (man'drel), *v. t.* [*mandrel*, *n.*] To operate upon with mandrels, as a bronze gun. This is done by driving steel mandrels of gradually increasing size through the bore, whereby the strength of the gun is greatly increased, the limit of elasticity being in some cases nearly or quite doubled.

mandrel-collar (man'drel-kol'gr), *n.* A collar formed on the mandrel of a lathe, against which the chucks, face-plates, etc., abut squarely when screwed upon the mandrel-nose.

mandrel-frame (man'drel-frām), *n.* A frame or head-stock secured by bolts to the end of a lathe-bed to support the mandrel.

mandrel-lathe (man'drel-lāth), *n.* A lathe adapted for turning long work and hollow work. It is so designed that the material for hollow work can be clamped by a chuck on the end of the mandrel in the head-stock. Long work is supported in the lathe by the head and tail centers. E. H. Knight.

mandrel-nose (man'drel-nōz), *n.* The inner end of a lathe-mandrel, upon which a screw-thread is formed for receiving and holding face-plates, chucks, etc.

mandrel-screw (man'drel-skrō), *n.* The screw on the mandrel-nose to which chucks, face-plates, etc., are fitted, and by which they are attached to the mandrel.

mandril, *n.* See *mandrel*.

mandrill (man'dril), *n.* [= F. *mandrill* = Sp. *mandril* = It. *mandrillo*, a mandrill; said to be from a native W. African name. Sp. It. forms are from E.] A kind of baboon; the great blue-faced or rib-nosed baboon; the hog-ape, *Cynocephalus maimon* or *mormon*, the largest and most formidable, ferocious, and hideous of baboons. The canine teeth are of enormous size, causing a protuberance of the cheeks, which are naked and fantastically striped with brilliant colors. The ischial callosities are of great size and bright-red color. The animal is often seen in captivity. The mandrills are natives of the western coast of Africa, where they associate in large troops, which are the terror of the negroes. They often plunder villages and cultivated fields with impunity. See cut under *baboon*.

It is gravel in the teeth, and a man must drink the blood of his own gums when he *manducates* such unwholesome, such unpleasant fruit. Jer. Taylor, *Works* (ed. 1835), I. 719.

manducation (man'dū-kā'shon), *n.* [= F. *manducation* = Sp. *manducacion*, < LL. *manducatio* (> *n.*), a chewing, < L. *manducare*, chew: see *manducate*.] The act or process of biting or chewing; mastication.

This personage figured in various public processions as well as in comedies on the stage, and served Roman mothers as a bugbear in restraint of childish misconduct.

Ch.*, a kind of large and loose mantle, resembling a cope, fastened at the throat and sometimes at the lower corners also, and reaching almost to the feet. It is worn by monks and nuns, by archimandrites, and at times by bishops who were regularly appointed from the monastic orders. The regular *man-eater* is generally an old tiger whose vigour is passed, and whose teeth are worn and defective; it takes up its abode in the neighbourhood of a village, the population of which it finds an easier prey than the larger or wilder animals. W. H. Flower, *Encyc. Brit.*, XXIII. 886.

3. One of several kinds of large sharks supposed to be specially formidable to man; specifically, *Carcharodon rondeletti*, a very large shark of the family *Lamnide*. This shark has straight narrow triangular teeth, very slightly serrated or crenulated, in both jaws. The body is stout and fusiform, with a pointed snout; there are two dorsal fins, one large, between the pectorals and the ventrals, the other small and posterior; the anal fin is like the second dorsal; the caudal fin is crescentiform; and there are five branchial apertures, all in front of the pectorals. It has been found 40 feet long, though it averages so much less that 13 feet is a good size. It is a shark of the high seas, found in nearly all tropical waters, frequently passing a considerable distance both northward and southward. Teeth much like those of the living species have been found in the Pliocene and Miocene deposits, as well as in the ooze of the Pacific ocean, indicating individuals that must have been about 80 feet long.

man-engine (man'en'jin), *n.* A form of elevator or power-ladder used in some deep mines for raising and lowering men. In its usual form it is essentially a vertical rod extending from the surface to the bottom of the mine, and reciprocated upward and downward, like a pump-rod, by means of a steam-engine or a water-wheel. The length of stroke commonly adopted is 12 feet, and at intervals equal to the stroke platforms are fastened to the rod, with corresponding platforms in the shaft, on either side of the rod, at points corresponding to the limits of the stroke, both up and down. A man in descending steps on a platform on the rod just as the down stroke begins, and steps off on the platform in the shaft which he reaches at the end of the stroke, repeating the operation until he attains his destination. A man in ascending steps on a platform on the rod as the upward stroke begins, and leaves it at the end of the stroke. Ascent and descent may proceed simultaneously without

interruption, the fixed platforms on one side of the shaft being reserved for men ascending, and those on the other side for men descending, each man stepping on his proper platform on the reciprocating rod as it is vacated, at the moment of rest between the strokes, by the man who is traveling in the opposite direction. This is the form of man-engine used in Cornwall. That employed in the Harz mines (where the method originated) is the "double-rod engine," with two rods moving up and down alternately in opposite directions. This contrivance corresponds to a ladder with movable steps, the miner having nothing to do but to move slightly sideways in order to place himself on the step which is about to go up or down, according as he wishes to ascend or descend. In the United States cages, and in some mines man-cars, are used instead of man-engines. See *man-car*.

manes (mā'nēz), *n. pl.* [L., prob. < OL. *manis*, *manus*, good.] 1. In *Rom. antiq.*, the spirits of the dead considered as tutelary divinities of their families; the deified shades of the dead, according to the belief that the soul continued to exist and to have relations with earth after the body had perished. Three times a year a pit called the *mundus* was officially opened in the comitum of the Roman Forum, to permit the manes to come forth. The manes were also honored at certain festivals, as the *Parentalia* and *Feralia*; oblations were made to them, and the flame maintained on the altar of the household was a homage to them. [In this sense often written with a capital.]

The most special representatives of ancestor-worship in Europe were perhaps the ancient Romans, whose word *manes* has become the recognized name for ancestral deities in modern civilized language; they embodied them as images, set them up as household patrons, gratified them with offerings and solemn homage, and, counting them as or among the infernal gods, inscribed on tombs D. M., "Dis Manibus."

E. B. Tylor, *Prim. Culture*, II. 109.

Hence—2. The spirit of a deceased person, or the shades of the dead, whether considered as the object of a cult or not.

The face is more produced than in the species of *Cercoptes* (from which *Cercocebus* is detached), the eyebrows are prominent, and the eyelids are white. The general color is dark or blackish. The sooty mangabey is *C. fuliginosus*; the white-eyed mangabey is *C. atropis*, in which the crown is also white. *C. collaris* has a white collar. In *C. albigena* the crown is crested. It is manufactured for use in the Bessemer process, and is an important adjunct to that operation. The object of the addition of the manganese at the termination of the "blow" is the removal of the oxygen in the iron, without at the same time adding carbon and silicon. This vitally important improvement of the Bessemer process is due to the Scotch metallurgist R. F. Mushet. See *steel* and *spiegel*.

manganesate (mang-ga-nē'sāt), *n.* [(< *manganese* + *-ate*.] Same as *manganate*.

manganese (mang-ga-nēs' or -nēz'), *n.* [= F. *manganèse* (> Sp. Fg. *manganesa* = It. *manganesa*), < NL. *manganesium*, an arbitrarily altered form of *magnesium*, a name first given to this metal, but now used for a different metal: see *magnesium*.] Chemical symbol, Mn; atomic weight, 55. A metal having a remarkable affinity for, and in some respects a close resemblance to, iron, of which it is an extremely frequent associate. It differs from iron, however, in that it is not used at all by itself in the arts, although of great interest and importance as connected with the manufacture of iron, and as modifying by its presence in small quantity the character of the product obtained. The use of the black oxide of manganese for removing the coloring matters from glass was known to the ancients, and is mentioned by Pliny, but the nature of the material thus used was not understood until quite modern times. This ignorance was shown in the confusion of the oxide of manganese with the magnetic oxide of iron, the lodestone (Latin *magnes* and *magnesium lapide*), and the former was called *magnesia* by chemists in the middle ages, apparently in conformity with Pliny's idea of a dual (masculine and feminine) nature in some metals, manganese not having the attractive power of the magnet, and being on that account considered feminine. Other variants (in the fifteenth and sixteenth centuries) of the name of the ore used by glass-makers were *magnesia*, *mangaderum*, and *manganesela*. After what we now call *magnesia* had received the name of *magnesia alba*, apparently from the idea that this substance was in some way related to the oxide of manganese, the latter began to be called *magnesia nigra*. From the middle of the eighteenth century the combinations of manganese were studied by various chemists, and finally, in 1774, the metal manganese was isolated by Gahn, but for years there was much confusion in regard to its specific name, and it was not until after the beginning of the present century that the name *manganese* (mangan in German) began to be generally adopted. The Latin termination in *-ium* (*manganesium*) is rarely used in modern technical works. This metal has never been found native. As eliminated from its ores by chemical processes, it is grayish-white in color, resembling cast-iron, but varying considerably in hardness and luster according to the nature of the methods by which it was obtained. It is very hard and brittle, and has a specific gravity of about 8. It oxidizes rapidly on exposure to the air. Manganese resembles iron in that its ores are widely diffused, and differs from that metal remarkably in the fact that, on the whole, its ores are only rarely found in considerable quantity in any one locality, while those of iron exist in abundance in many regions. The important ores of manganese are all oxides, and of these the peroxide (pyrolusite), called in commerce the *black oxide of manganese*, or simply *manganese*, is the most valuable and important. Other manganiferous minerals (all oxides) are braunite, hausmannite, psilomelane, and various earthy mixtures called *dog-manganese*, *wad*, *cupreous manganese*, etc. Practically, the ore called *manganese* in commerce is a mixture of various oxides, different samples differing greatly in value, which value has to be determined by chemical analysis. The ores and salts of manganese are of very considerable importance in chemical manufactures, both as bleaching and oxidizing reagents. The na-

ture and importance of this metal in the manufacture of iron and steel will be found indicated under *steel* and *spiegel*.—*Earthy manganese*. See *wad*.—*Gray manganese ore*. Same as *manganite*.—*Manganese bronze*, an alloy said to be composed of ordinary bronze with the addition of manganese. It has the color of gun-metal, and its fracture resembles that of fine-grained steel. It is said to equal or excel in tenacity bar-iron of medium quality. It has been manufactured in England, but has not come into general use.—*Manganese brown, green, violet*, etc. See *brown*, etc.—*Manganese copper*. Same as *manganese bronze*.—*Manganese epidote*, *pleidmontite*. See *epidote* and *pleidmontite*.—*Manganese garnet*, *spessartite*. Manganates of the alkalis are formed when manganese dioxide is heated with an alkali carbonate or nitrate. They have a green color, and readily decompose, forming permanganate and manganese dioxide. The crude alkali manganate was formerly called *chameleon mineral*, from the property which its solution has of passing rapidly through several shades of color, occasioned by changes in its state of oxidation. As formerly made, it consisted of an oblong rectangular wooden chest which rested upon two cylinders. The chest was loaded with stones to make it press with sufficient force upon the cylinders, and was moved backward and forward by means of a wheel and pinion, the rollers being thus made to pass over and thoroughly press the articles spread on a polished table underneath. Mangles of this construction have, however, been generally superseded by mangles which act in the manner of a calender or a clothes-wringer, the cloth to be smoothed being passed between one or more pairs of rollers.

1. A tree of the genus *Rhizophora*, chiefly *R. mucronata* (*R. Mangle*), the common mangrove, abounding on tropical shores in both hemispheres. It is a low tree of most singular habit, remarkable for a copious development of adventitious roots, which arch out from the lower part of the trunk, and at length descend from the branches; it is peculiar also in that its seed germinates in the fruit, sending down its radicle into the mud, sometimes a distance of several feet, before detachment from the parent. By these means the mangrove spreads thickly over the tidal mud, forming impenetrable and highly malarial bogs, hundreds of miles in length. The wood is valuable for fuel, for piles, etc., and is susceptible of a beautiful polish. The astringent bark is useful in medicine and for tanning. The fruit is of a dry and coriaceous texture. See cut in preceding column.

2. Another plant of similar habit, especially a plant of the genus *Avicennia*. They are littoral trees, widely diffused in the tropics, throwing out a tangled mass of arching roots above ground, and sending up abundant asparagus-like shoots from the underground roots. The seed also germinates as it ripens. *A. officinalis* (including *A. tomentosa*), called *white mangrove*, extends to Australia and New Zealand, the manava of the Maoris, mistakenly reported to yield an aromatic gum. *A. nitida* of tropical America and Africa is the black or olive mangrove. In a *mania* in this strict sense there may be delusions, but they fall of the systematized character of those of *paranoia*. Delusions and hallucinations may also be present. The attack may last for days, or months, or years. The prognosis is not very unfavorable. The cases issue in recovery, in death by exhaustion and intercurrent disease, and a considerable proportion in permanent imbecility.

II. n. One of a religious body, adherents of Mani, Manes, or Manichæus, a native of Persia or some neighboring country, in the third century. Its doctrines and features were derived from Gnostic, Buddhist, Zoroastrian, and various other sources. These it attempted to combine with Christianity, and it is generally classed among Gnostic sects. Its theology was dualistic, representing the conflict between light and darkness, and including belief in the inherent evil of matter. Its morality was professedly ascetic, but profligacy of life and cruel or immoral ceremonial were generally attributed to it in both its earlier and its later forms. It had an organized priesthood, and recognized a distinction between its esoteric class (the "elect" or "perfect") and the "hearers." It originated in Persia, but soon extended into the Roman empire, and existed as late as the seventh century. The Paulicians, Albigenses, Catharists, etc., developed it into new forms, retaining many of its features, and hence were styled "New Manichæans." The title *Manichean*, or *New Manichean*, was an epithet used opprobriously in the controversies of the middle ages.

The under parts are hairy; teeth are wanting; the hind feet are plantigrade and five-toed, and the fore feet are also pentadactyl, but the digits are so shaped that the animal walks on its knuckles. The placenta is diffuse and non-deciduate. The family includes 6 or 8 species, referable to 3 genera, *Manis*, *Pholidotus*, and *Smutsia*. See cut under *pangolin*. See *hypermetropia*. — **Manifest polysyllogism**, a series of syllogisms each set forth in full. — **Manifest quality**, in *philos.*, a quality intelligible in its own nature or as it exists in the thing itself. = *Syn.* *Clear*, *Plain*, *Evident*, *Manifest*, *Obvious*, *patent*, *palpable*, *unmistakable*, *conspicuous*. The first five words agree in representing the object as though viewed with the eye. What is *clear* can be seen without dimness; what is *plain* can be seen by any one at the first glance, without search or study. *Evident* suggests something more of a mental process, but no difficulty in seeing that the thing is true. *Manifest* is a degree stronger than *evident*, the mind getting the truth as by an intuition. *Obvious* by derivation applies to that which lies so directly in our way that we cannot help coming upon it and seeing it; that which is *obvious* needs no pointing out or explaining. We speak of a *clear* case of self-deception; a duty that is *plain*; an *evident* mistake; a *manifest* misunderstanding; an *obvious* inference, not needing to be actually put into words.

In Anglican churches maniples are worn, as in the medieval church, three or four feet in length; in the Roman Catholic Church they are now much shorter. The maniple seems to have first come into use in the eighth century, and was originally a piece of white linen used as a handkerchief. Till the twelfth century and later it continued to be held in the hand. There is no corresponding vestment in the Eastern Church, though some writers have confounded the epimanikion with it. And when the children of Israel saw it, they said one to another, It is manna [in the Vulgate: "Manhu? quod significat: Quid est hoc?"] for they wist not what it was" (Ex. xvi. 14, 15), implying that the name thus arose from the question, Heb. mán hû, 'what is this?'; but this is doubtless a popular etymology. The name is otherwise referred to Heb. man, a gift, Ar. mann, favor.] 1. The food by which the children of Israel were sustained in the wilderness (Ex. xvi. 14-36; Num. xi. 6, 7). The circumstances attending the gift of manna show that it was believed to be miraculous. Modern commentators differ in opinion as to its probable nature: by some it is identified with an exudation of the tamarik-tree, and by others with a lichen which, torn from its home and carried vast distances by the wind, still falls and is gathered for food in the Sinaitic peninsula (see *manna-lichen*); and by others it is regarded as a special and miraculous creation.*

4. In *phar.*, a sweet concrete juice obtained by incisions made in the stem of *Frazinus Ornus*, a native of Sicily, Calabria, and other parts of the south of Europe, and from other species of ash. It is either naturally concreted or exsiccated and purified by art. At the present day the manna of commerce is collected exclusively in Sicily, where the manna-ash is cultivated for the purpose in regular plantations. The best manna is in oblong pieces or flakes of a whitish or pale-yellow color, light, friable, and somewhat transparent. It has a slight peculiar odor, and a sweetish taste mixed with a slight degree of bitterness, and is employed as a gentle laxative for children or persons of weak habit. It is, however, generally used as an adjunct to other more active medicines. It consists principally of a crystallizable sweet substance named *mannite*, and certain other substances in smaller quantity. Sweetish secretions exuded by some other plants growing in warm and dry climates, as the *Eucalyptus viminalis*, the manna-gumtree of Australia, and the *Tamarix Gallica*, var. *mannifera*, of Arabia and Syria, are also considered to be kinds of manna. Manometers which measure elastic gaseous pressure by the tension of a spring are used for steam-gages.

In some forms the pressure of the gas is on a piston or diaphragm connected with a counterbalancing spring. In others the initial pressure is received on a small primary piston, or diaphragm, and transmitted by a fluid mass acting upon a secondary and much larger piston or diaphragm upon which the pressure per unit of area is reduced inversely as the area of the smaller piston is to that of the larger. Of this kind is Shaw's gage for measuring very high pressures. In the Bourdon steam-gage a curved tubular spring is used, having its interior connected by a tube with the interior of the tank, boiler, cylinder, or gas-holder containing the vapor or gas to be tested. In all of these forms the parts moved under varying pressure are connected with an indicator, and the pressure is read on a graduated dial-plate. In the open-air manometer the elastic pressure of a gas is indicated by the height of a column of liquid, usually mercury or water, which it will support. In its simplest form an S-shaped glass tube, open at the upper end, is employed, as shown in the cut. In the compressed-air manometer the tube containing the liquid is closed at the top, and hence the varying elastic pressure of the confined air is added to the weight of the liquid column in balancing the gaseous pressure to be measured. The static manometer of Boyle has a thin glass bulb counterpoised on a pair of delicate scales, the specific gravity of the bulb and its confined air varying with both pressure and temperature of the surrounding air. The manometer of Ramsden is essentially a compressed-air manometer combined with a scale which indicates temperatures while determining atmospheric density. The ordinary gas-gage is a simple open-air manometer.

Rob. of Gloucester, p. 484, note.

These *manors* [those with which England was covered about the time of the Domesday Survey] were in fact in their simplest form estates of manorial lords, each with its village community in villenage upon it. The land of the lord's demesne—the home farm belonging to the manor-house—was cultivated chiefly by the services of the villata, i. e. of the village community or tenants in villenage. The land of this village community, i. e. the land in villenage, lay round the village in open fields. In the villages were the messuages, or homesteads of the tenants in villenage, and their holdings were composed of bundles of scattered strips in the open fields, with rights of pasture over the latter for their cattle after the crops were gathered, as well as on the green commons of the manor or township.

Seebohm, Eng. VII. Community, p. 78.

The name *manor* is of Norman origin, but the estate to which it was given existed, in its essential character, long before the Conquest; it received a new name as the shire also did, but neither the one nor the other was created by this change.

II. n. 1. A book, paper, or instrument written by hand with ink or other pigment, or with a pencil or the like; a writing of any kind, as distinguished from anything that is printed. Especially—2. Such a book, paper, or instrument so written before the introduction and general adoption of printing in the fifteenth century, or in a style in vogue before the invention of printing. The oldest surviving manuscripts are Egyptian, of which some are at least 3,500 years old. Ancient manuscripts are written on papyrus, parchment, or vellum, and are usually in the form of a long band which was rolled for convenience about a rod. Greek manuscripts are in uncial, cursive, or minuscule characters. The uncials are the oldest form, and resemble modern capitals. The cursive characters are derived from the uncials, though they came to differ much from these in shape, and are used in manuscripts from the second century before Christ. The minuscule writing is that practised with few or no exceptions since the ninth century; the forms of the earliest printed Greek closely resemble it. Latin manuscripts are in capital, uncial, cursive, or minuscule characters. The capitals are the earliest form, but their use was not entirely discontinued until the Carolingian epoch. The uncials, of which the letters are characterized by their rounded shape, were developed very early, attained their highest perfection in the fourth century, and continued in use until the ninth century. The cursive writing was developed from the uncial; it appears in the graffiti found scratched on the walls of Pompeii, Rome, etc., and is the parent of many old systems of writing, as the Lombard and Merovingian. The minuscule style was developed in the eighth century, in the monastery of St. Martin at Tours, and reached its perfection in the twelfth century. In this style are written the splendid manuscripts of the middle ages, produced for the most part in monasteries, and enriched with superbly illuminated initial letters and elaborately painted miniatures. Upon the introduction of printing, the minuscule writing supplied models to the earliest type-makers. *Palimpsest manuscripts* are manuscripts written in antiquity or in the early middle ages upon papyrus or vellum from which earlier writing had been erased. Modern science has been successful in deciphering the imperfectly effaced characters of many such manuscripts, and has recovered in this way some of our most valuable remnants of classic literature. The three most important Biblical manuscripts extant are the Alexandrian Codex, the Vatican Codex, and the Sinaitic Codex. (See *codex*.) These are of course all uncials. See *capital*, *cursive*, *majuscule*, *minuscule*, *uncial*. Often abbreviated *M.S.*, plural *MSS.*

A drawing upon a plane surface representing a part or the whole of the earth's surface or of the heavens, every point of the drawing corresponding to some geographical or celestial position, according to some law, of perspective, etc., which is called the *projection*, or, better, the *map-projection*. See *projection*. A map of the earth, or of a part of the earth, frequently exhibits merely the positions of countries, mountains, rivers, lakes, cities, etc., relatively to one another, and, by means of lines of latitude and longitude, relatively to every other point on the earth's surface. Maps may be so colored or shaded as to give a variety of information: for example, to indicate the geological structure, the amount of rainfall, the principal productions, or the languages spoken. There are thus geological, meteorological, linguistic, faunal, and other kinds of maps. In maps on a large scale, or those which are the

result of careful topographical surveys, the relief of the surface is generally indicated with more or less accuracy. This is done either by contour-lines or hachures, or by simple shading. By the latter method, as ordinarily practiced, the indications of the relief of the surface are but rough in character. With sufficiently accurate data and a careful and artistic treatment, a close approach may, however, in this way be made to the effect obtained by photographing a model of the surface in question in an oblique light. From such a photograph the eye gets at once a very clear idea of the character of the surface.

Maranta (ma-ran'tā), *n.* [*NL.* (Plumier, 1703), named after B. Maranta, a Venetian physician and botanist of the 16th century.] 1. A genus of monocotyledonous plants of the natural order *Zingiberaceae*, type of the tribe *Marantæ*. It is distinguished by the one-celled ovary, the slender-branched inflorescence, and the narrow involute bracts, closely surrounding the branches. They are herbaceous plants with fleshy tubers, sheathing leaves, and a few-flowered inflorescence, the flowers having a cylindrical corolla-tube, and a petaloid filament bearing a one-celled anther. There are about 15 species, indigenous to tropical America, but several species are widely cultivated for their fleshy tubers. The pure kind of starch known as *arrow-root* is obtained from the tubers of *M. arundinacea* and of several other species, by maceration, washing, and drying. (See *arrowroot*.) Several species have highly ornamental foliage, as *M. (Calathea) zebina*, the zebra-plant, whose leaves are 2 feet long and 6 inches wide, of a deep rich green, purple-shaded, and with a velvety appearance. See also *therite-fiber*.

They are coarse-habited plants, having large scaly rhizomes and ample twice- or thrice-pinnate fronds, with oblong pinnules, bearing the sori in lines near the margin. Many fossil ferns showing both fronds and fructification closely resembling those of this genus occur, chiefly in Triassic (Rhetic) strata, and were called *Marattiopsis* by Schimper, who united with that genus all the forms which had been called *Angiopteridium*, since found very abundant in the Mesozoic beds of India, and quite recently in the Potomac formation of Virginia.

They differ from the true ferns on the one hand by the absence of the jointed ring of the spore-case, and from the *Ophioglossaceae* on the other by the circinate venation. By some authors they are regarded as a distinct class, of equal rank with the true *Filices* and *Ophioglossaceae*. Called *Danaeaceae* by Agardh.

Limestone in a more or less crystalline or crystalline-granular condition. Any limestone, however, even if very compact or showing only traces of a crystalline structure, may be called *marble* if it is capable of taking a polish, or if it is suitable or desirable for ornamental and decorative purposes. The presence of magnesium carbonate associated with the calcium carbonate, forming dolomitic limestone or even pure dolomite, does not in any way influence the nomenclature of the rock; indeed, such presence cannot usually be known except from chemical analysis. Marble is a material of great importance in architecture, not only for exterior use, but for interior decoration in large, costly monumental structures. Thirty-three varieties of ornamental stone are used in the interior of the Grand Opera House in Paris, and a large proportion of these may be classed as marbles. The value and beauty of marble depend largely on its coloration. Perfectly pure carbonate of lime, dolomitic limestone, and dolomite are all colorless, and white marbles—or at least such as are only slightly tinged with color—are very abundant. White marble such as is used for statuary (for which purpose it must be obtained in large blocks free from flaws or defects of any kind, and perfectly uniform in tint) is extremely rare. Among the finest statuary-marbles are those used in the masterpieces of Greek sculpture, of which that from the island of Paros is generally admitted to surpass all others, especially in the possession of a certain amount of translucence by which the artistic effect of the work is heightened. The Parian quarries seem, however, to have been practically exhausted. The Pentelican marble, obtained from quarries near Athens, stood next to the Parian in ancient times, and its quarries are still apparently inexhaustible. At the present time the artistic world is supplied with statuary-marble from quarries in the Apennine mountains overlooking the Bay of Spezia, and in the vicinity of Carrara, Massa, and Serravalle. From this marble were carved the finest works of Michelangelo. These quarries, which have been extensively worked for 2,000 years, furnish, in addition to the white, a large amount of variegated marble, especially of the variety known as *bardiglio*. The number and variety of colored and variegated marbles used for various artistic and architectural purposes is very great. Entirely black marble capable of taking a fine polish is rare; much more common are varieties irregularly shaded with gray, bluish-gray, or dove-colored tints. Bright colors—red, yellow, green, and blue—are much rarer than the less brilliant shades, but they are seen in some marbles, and are occasionally so blended and interbanded as to produce extremely beautiful effects. These brilliant colorations are chiefly due to the presence of iron in various combinations; dark and grayish shades are generally caused by the presence of a greater or less amount of organic matter. In many varieties of marble the presence of organic remains embedded in the rock adds greatly to its attractiveness. Joints and stems of encrinurus, as well as many other kinds of fossils, occur in this way, and by contrast of their color with that of the material in which they are inclosed, as well as by the gracefulness of their forms, produce a very fine effect. Fragments of shells embedded in calcareous rocks sometimes exhibit a brilliant display of iridescent coloration: such marbles are known as *lumachelles*, or, sometimes, *fire-marbles*. A beautiful effect is occasionally produced as the result of deposition of the calcareous material in stalagmitic form, so that when cut and polished the marble exhibits concentric zones of various tints; varieties having this structure are frequently called *onyx marble*. The vicinity of the Mediterranean is the classic region of marbles. Italy, France, and Spain are rich in beautiful varieties, and these are seen in the greatest number and to the best advantage in the architectural works of ancient and modern Rome. For this reason many of the rarest and most attractive marbles are best known by Italian names, and these names are frequently applied to varieties occurring far away from the Mediterranean, from either real or fancied similarity to the Italian marbles. Some of the best-known and most highly prized classic variegated marbles are the following. *Africano*, from the island of Chios, is a lumachelle, or shell-marble, exhibiting a great variety and brilliancy of coloration, reddish and purplish tints predominating. *Bardiglio* is common in the Apennine quarries, of a grayish- or bluish-white color, traversed by darker veins of the same. *Brocatel* and *brocatellone* are extremely variegated marbles, with numerous interlacing veins of yellow, violet, and crimson tints, on a yellowish ground; marble bearing these designations has been and still is quarried in various places, and especially near Tortosa in Spain. *Cipollino* is a marble with more or less of a concretionary structure, of many tints and much variety in its arrangement, with corresponding names, such as *cipollino verde*, *mandorlato* (having almond-shaped patches of color), *rosso*, etc.; a fine example of this marble may be seen in the columns of the Braccio Nuovo of the Vatican. *Flor di persico* is an exquisitely beautiful marble, with a reddish and crimson shading on a white base: called by the ancients *marmor Molossium*, because coming from the region inhabited by the Molossai, in what is now Albania, on the eastern coast of the Adriatic. *Giallo antico* or *Numidian marble* is an

Shell-marble.

extremely beautiful marble quarried in northern Africa; it was highly esteemed and extensively used by the Romans. The tints are variable, red and yellow predominating; the different varieties were designated by names indicating the prevailing tints. *Giallo di Siena* is a beautiful yellow marble of various depths of color, with darker veins, in which violet hues predominate: when these veins are very numerous the marble becomes a *brocatel*. *Pavonazzo* and *pavonazetto* are various red and purplish marbles and breccias, some of the latter being also true marbles, but having a more or less brecciated character. The most beautiful pavonazetto is that called by the Romans *marmor Synadicum* or *Phrygian marble*, from the locality where it was obtained; it is characterized by a very irregular venation of dark-red with bluish and yellowish tints, ramifying through a translucent alabaster-like base, which is sometimes almost opaline in its play of colors. *Rosso antico* is a marble of very deep red color, sometimes of various shades, occasionally streaked or clouded with dark-purple or whitish tints. The original locality of the classic rosso antico has not been discovered, but some modern red marbles closely resemble this variety. Some of the most highly prized French colored marbles bear names peculiar to France. (See *griotte*, *portor*, *sarrancolin*.) The Devonian and Carboniferous of England and Ireland furnish a considerable number of ornamental marbles. Devonshire and Derbyshire are the counties in which the best-known English varieties are obtained. The finest Irish variegated marbles are quarried near Armagh, and at various localities in county Cork, also at Killarney, and on the islands of the Kenmare river; and marble called *Siena* is obtained from several places in King's county and near Shannon Harbor in Galway. The most important quarries of white and grayish marble in the United States are those in the Lower Silurian of Vermont and western Massachusetts. There are very extensive marble-works at Rutland in Vermont, at Lee in Massachusetts, and at many other points in the same geological formation. Some of the variegated marbles found on the islands and near the shores of Lake Champlain are very handsome, but they are not extensively worked. The most popular colored marble in the United States at the present time is the Tennessee, a light-grayish stone beautifully mottled with shades of pinkish red. This marble has been extensively employed in the capitols at Washington and Albany.

A little ball of marble or other stone, or of baked clay, porcelain, or glass, used by children in play; an alley.—4. In *glass-blowing*, a block or thick piece of wood in which are formed hemispherical concavities, used in the manufacture of flasks, etc., to shape the fused glass gathered upon the end of the glass-blower's pipe into an approximately spherical form by pressing and turning it over in the concavities preparatory to the blowing. The most valuable object in this collection is the inscribed slab called the *Parian Chronicle*, from having been kept in the island of Paros. In its perfect state, the inscription contained a chronicle of the principal events in Grecian history from the time of the mythical Cæcrop to the archonship of Diognetus (364 B. C.); but the part of it covering the last ninety years is now lost, and much of what remains is corroded and defaced.—*Elgin marbles*, a collection of ancient sculptures, for the most part of the school of Phidias and from the Parthenon at Athens, taken to England during the first years of the nineteenth century by the Earl of Elgin, and now preserved in the British Mu-

Specimen Slab of the Elgin Marbles.—A central piece of the Parthenon frieze, with figures of Athena and Hephaestus.

seum. These sculptures are the finest surviving work of ancient artists, and comprise the greatest part now in existence of the sculptured decoration of the Parthenon, including the splendid fragments of the pediment statues, a great number of metopes, and an extended series of the blocks carved in low relief of the cella frieze. The removal of the marbles, many of which were torn violently from their original positions upon the Parthenon, to the further damage of that monument, was in itself an act of vandalism; but their transportation to England at a time when Greece was accessible with difficulty opened the

eyes of the world to the preëminence of Greek work. It was one of the first steps toward securing an accurate knowledge of Hellenic ideals, and has thus influenced contemporary civilization.—*Entrochal marble*. See *entrochal*.—*Hymettian marble*. See *Hymettian*.—*Kilkenny marble*, a variety of fine black marble containing shells, much used for mantelpieces.—*Ligneous marble*. See *ligneous*.—*Madrepore marble*. (197–159 B. C.) in commemoration of splendid victories over the invading Gauls. Abundant remains of these sculptures have been unearthed since 1875 by Karl Humann, and are now in the Berlin Museum. See *Pergamene art*, under *Pergamene*.—*Petworth marble*, also called *Sussex marble* (both names arising from its being worked at Petworth in Sussex), a variously colored limestone occurring in the Weald clay, containing the remains of fresh-water shells.

The fluid colors are sprinkled or spattered over this layer with a brush, either in the arrangement intended for use or in a manner which will admit of producing the desired figuration by drawing a brass comb over the surface. The dampened paper, held by the ends, is lightly passed in a curve over this surface, taking up the colors, and finished by sizing and burnishing or calendering.

It was made into pins, watch-cases, shoe- and knee-buckles, and other ornaments.

It has a lower specific gravity than ordinary pyrite, and on an untarnished surface a somewhat paler color, in consequence of which it is often called *white iron pyrites*. The crystallized varieties take various imitative forms called *cockcomb pyrites*, *spear pyrites*, etc.; the massive kinds are often radiated, concretionary, etc. Marcasite is much more liable to alteration than ordinary pyrite, passing by oxidation into iron sulphate or copperra. The two kinds of iron pyrites often occur together, and the greater the proportion of marcasite the more the liability to alteration; this has been shown (Julien) to be an important element in the durability of building-stones containing pyrites.

The troops are relieved by changing the gait, alternating the double with the quick time, and in the cavalry the horses are relieved for fifteen minutes every hour by the dismounting and marching of the men. Any distance over twenty miles a day is reckoned a *forced march*.—**March past**, the march of a body of soldiers in front of a reviewing officer or some high dignitary.

margin (mār'jin), *n.* [*Also marge* (*< F.*), formerly also *margin* (and *margent*, *q. v.*); *< ME. margin*, *margyne*, *< OF. margine* (usually *marge*, *F. marge*) = *Sp. margen* = *Pg. margem* = *It. margine*, a border, margin, = *Serv. marginj*, a hill (as a boundary, an ant-hill, mole-hill), *< L. margo* (*margin-*), edge, brink, border, margin: see *mark*¹.] 1. A bordering or bounding space; a border; a space between one edge or line and another, as that along a river between the edge of the water or of its bed and a real or imaginary outer line, or the like, or that between the edges of a leaf or sheet of paper and those of the printing or writing on it. In some plants the leaf (then called *marginate*) has a distinct margin or border of different formation or coloration from the main body. In the case of a book, *margin* alone usually means the clear space between the print and the outer edge of the leaf, called distinctively the *front margin*; the *head* or *top margin* is at the top of the page, the *tail* or *bottom margin* at the foot, and the *back margin* on the inner side against the back. Parts of these margins, especially at the sides, may be occupied by marginal notes, remarks, or the like. An *opened margin* is one where the leaves have been opened or separated, as with a folder, but not trimmed; an *uncut margin* has not been cut anywhere; a *rough-cut margin* has only the more protruding ragged edges cut off with scissors; in a *cropped margin* too much paper has been cut away; in a *bled margin* part of the print has been cut away.

Whittier, *Mogg Megone*, II.

Specifically—(*a*) In an engraving, the paper left blank outside the plate-mark. (*b*) In *entom.*, properly, the outer part of a surface or distinct portion of the integument, as distinguished from the central part or disk. In this sense *margin* is not to be confounded with *edge*, which is used to denote the extreme boundary of a part; but where distinction is unnecessary, the two terms are often used synonymously. (*c*) In *conch.*, the edge or entire outline of a bivalve shell. (*d*) In *bot.*: (1) The edge. (2) A distinct border, different from the body of the organ, as the membranous expansion surrounding some seeds or seed-vessels; a narrow wing.

5. In speculative dealings on the exchanges: (a) The sum in money, or represented by securities, deposited by a speculator or trader with his broker as a provision against loss on transactions made on account. This margin is usually reckoned at 10 per cent. of the par value of stocks or bonds, and 10 cents per bushel or barrel on grain or oil. If the price rises or falls to a satisfactory extent, a sale or purchase is made, and the gain is the customer's profit, less the broker's charges; if the price falls below or rises above the margin furnished, and the purchase is to be protected in expectation of a future rise or fall, the customer is required to furnish ("put up") more margin to cover the difference.

The banks refused to loan upon any except first-class collateral, and commission-houses regarded the market as in a somewhat dangerous condition for speculators on *margin*. *Appleton's Ann. Cyc.*, 1886, p. 342.

(b) A deposit made by each of two brokers, parties to a contract, when one is "called up" (as it is termed) by the other. This mutual deposit (usually of 5 per cent.) is made in some bank or trust company agreed upon, and remains subject only to a joint check or draft during the continuance of the contract upon which it has been called. — *Cardinal*, *costal*, *dentate*, *dilated margin*. This right, which originated in the interest of the feudal superior to secure a fit tenant, grew to be a pecuniary resource, and was enforced by imposing on heirs and heiresses refusing to be thus disposed of, or marrying without royal consent, a forfeiture of double the value of the right of disposal thus denied.

marital (mar'i-tal), *a.* [= F. *marital* = Sp. Pg. *marital* = It. *maritale*, *< L. maritalis*, of or

ML. marca, border, march (see march¹); = L. margo, edge, marge, margin (> E. margin, marge), = Zend maresu, boundary. The sense 'boundary' is older as recorded, though the sense 'sign' seems logically precedent. The two groups may indeed be from entirely different roots.] 1. A visible impression made by some material object upon another; a line, dot, dent, cut, stamp, bruise, scar, spot, stain, etc., consisting either of the visible effect produced by the impressing object or the transfer of a part of its substance. A mark in this general sense is understood to be an incidental or a casual effect, without significance except with reference to means or results.

Ye shall not make any cuttings in your flesh for the dead, nor print any marks upon you.

Lev. xix. 28.

I have some marks of yours upon my pate.

Shak., C. of E., l. 2. 82.

Specifically—2. An impressed or attached sign, stamp, label, or ticket; a significant or distinguishing symbol or device; that which is impressed or stamped upon or fixed to something for information, identification, or verification: as, a manufacturer's marks on his wares (see *trade-mark*); the mark made by an illiterate person opposite or between the parts of his name when written by another on his behalf; a merchant's private marks on his goods, to indicate their price or other particulars to his assistants; a mark branded on an animal by its owner; to give a student so many marks for proficiency. See *hall-mark*. In ceramics the mark is a cipher, word, or other device put upon a piece of ware, usually on the bottom or the under side, as an indication of the pottery from which it comes, a signature of the painter who decorated it, or the like. Such marks are often impressed in the clay before the glaze is applied, and often painted under the glaze, or otherwise permanently affixed. Very rarely they form a part of the decoration, as the Chinese characters painted in gold or in red on the Japanese ware known as Kaga or Kutani. On a nautical lead-line a mark is one of the measured indications of depth, consisting of a white, blue, or red rag, a bit of leather, or a knot of small line.

The Lord set a mark upon Cain, lest any finding him should kill him.

Gen. iv. 15.

Dost thou use to write thy name? or hast thou a mark to thyself?

Shak., 2 Hen. VI., iv. 2. 110.

Nineteenth Century, XXIV. 918.

3. A distinguishing physical peculiarity; a spot, mote, nevus, special formation, or other singularity; a natural sign: as, a birth-mark; the marks on sea-shells or wild animals. In farriery the mark is a deep median depression on the cutting surface of the incisor tooth of a horse, due to the inflection of a vertical fold of the tooth. It is seen of different characters according to the wear of the tooth, being thus to some extent an index of a horse's age. It disappears after the tooth is worn down beyond the extent of the fold. The dark color is due simply to the accumulation in the fold of food or dirt. See the quotation under *mark-tooth*.

He that by good use and experience hath in his eye the right mark and very true lustre of the diamond rejecteth and will not look upon the counterfeit, be it ever so well handled, ever so craftily polished!

Sir T. More, Utopia (tr. by Robinson), Int., p. xc.

For marks deared in men's nativity
Are nature's faults, not their own infamy.

Shak., Lucresia, I. 538.

4. A significant note, character, sign, token, or indication; a determinative attestation. In logic, to say that a thing has a certain mark is to say that something in particular is true of it. Thus, according to a certain school of metaphysicians, "incognisability is a mark of the Infinite."

Evelyn, Diary, Oct. 30, 1640.

A mark is that in a thing which constitutes a part of the cognition of it; or, what comes to the same thing, a partial representation, so far as it is considered as a ground of cognition of the whole representation. All our concepts are therefore marks, and all thinking is nothing but representing by marks.

Kant, Logic (trans.), Int., viii.

5. A guiding or indicative sign or token. (a) That which serves as an indication of place or direction; an object that marks or points out: as, a book-mark; boundary-marks; to guide a vessel by land-marks on the shore.

Freble, Hist. of the Flag, p. 28.

6. An object aimed at; a point of assault or attack; especially, something set up or marked out to be shot at: often used figuratively: as, to hit or miss the mark; a mark for detraction.

14. In the middle ages, in England and Germany, a tract of land belonging in common to a community of freemen, who divided the cultivated portion or arable mark among their individual members, used the common or ordinary mark together for pasturage or other general purposes, and dwelt in the village mark or central portion, or apart on their holdings. It was a customary tenure, like that of the existing Russian *mir*, and was similarly managed and governed.

The Mark System, as it was called, according to which the body of kindred freemen, scattered over a considerable area and cultivating their lands in common, use a domestic constitution based entirely or primarily on the community of tenure and cultivation.

Dan. *mark*; usually identified, in the orig. supposed sense a 'stamped coin,' with *mark*¹, a sign, stamp; but the sense of 'a particular weight' seems to be older.] 1. A unit of weight used in England before the Conquest, and in nearly all the countries of Europe down to the introduction of the metric system, especially for gold and silver. It was generally equal to 8 ounces. In 1524 the Cologne mark was made the standard for gold and silver throughout the German-Roman empire, and copies were distributed to all the principal cities. But, owing to the carelessness with which these were made, preserved, and copied, the Cologne mark came to have different values in different places. The following table shows the values of some of the principal marks in English troy grains, either directly as given, or reduced from French grains, doll, or milligrams. The larger discrepancies are in most cases due to known changes of standards.

The Maronites were originally Monothelites, but they entered into a partial union with the Roman Catholic Church in 1182, which after an interruption was made closer in 1445 and again in 1596. They still retain their own patriarchate of Antioch (now seated at Knabnin), their Syriac liturgy (although Arabic is now their vernacular tongue), the marriage of priests, their traditional fast-days, and the use of both elements in lay communion. The Maronites as a tribe were formerly under the same local government as the Druses, with whom they have had some bloody conflicts. The legal union of a man with a woman for life; the state or condition of being married; the legal relation of spouses to each other; wedlock. In this sense marriage is a status or condition which, though originating in a contract, is not capable of being terminated by the parties' rescission of the contract, because the interests of the state and of children require the affixing of certain permanent duties and obligations upon the parties.

2. The formal declaration or contract by which act a man and a woman join in wedlock. In this sense marriage is a civil contract, implying the free and intelligent mutual consent of competent persons to take each other, as a present act, as husband and wife; and according to the modern and most prevalent view no formalities other than such as the law of the jurisdiction may expressly impose are necessary to prevent either from subsequently repudiating the other or denying the legitimacy of their issue. The formalities provided for by the law of some of the United States are optional, being intended chiefly to enable the parties to preserve authentic evidence of the contract. When a man and a woman live and cohabit together, and conduct themselves as man and wife in the society and neighborhood of which they are members, till the belief and reputation that they are married become general, their marriage is presumed, without other evidence, for purposes of enforcing rights and liabilities of third persons.

Marriage, Wedding, Nuptials, Matrimony, Wedlock.* Marriage is the act of forming or entering into the union, or the union itself. Wedding generally includes the ceremonies and festivities attending the celebration of the union or marriage, but not essential to it; marriages are often made without such ceremonies. Nuptials is more formal than wedding: we speak of the nuptials of a prince. Matrimony is the married state, or the state into which a couple are brought by marriage. Wedlock is the vernacular English word for matrimony, not differing from it in meaning, but being the ordinary term in law: as, born in wedlock.

A soft tissue found in the interior of bones, both in the cylindrical hollow of the long bones and in the hollows of cancellated bony structures; the medulla or medullary matter of bone. It varies greatly in different situations. Ordinary marrow of the shafts of adult bones, as the humerus and femur, is a soft yellow solid, consisting of about 95 per cent. of fat. The red marrow of various bones, vertebral, cranial, sternal, and costal, is softer, and contains very few fat-cells, but numerous marrow-cells and cells resembling the nucleated red corpuscles of the embryo. The so-called spinal marrow, or medulla spinalis, is the spinal cord, the central axis of the nervous system, a tissue of an entirely different character, not found in the hollow of a bone, but in the cavity running through the chain of vertebrae.

Mars (mārz), *n.* [*L. Mars (Mart-), OL. Mavors (Mavort-); also Marmar, Oscan Mamers (Mamert-), Mars.*] 1. A Latin deity, identified at an early period by the Romans with the Greek Ares, with whom he had originally no connection. He was principally worshipped as the god of war, and as such bore the epithet *Gradivus*; but he was earlier regarded as a patron of agriculture, which procured him the title of *Silvanus*, and as the protector of the Roman state, in virtue of which he was called *Quirinus*. In works of art Mars is generally represented as of a youthful but powerful figure, armed with the helmet, shield, and spear; in other examples he is bearded and heavily armed. See out under *Ares*.

The mailed *Mars* shall on his altar sit
Up to the ears in blood.
Shak., I. Hen. IV., IV. 1. 117.

2. The planet next outside the earth in the solar system. Its diameter (about 4,200 miles) is only 0.53 that of the earth, its superficial 0.23, and its volume 0.147. Its mean density is 0.71 that of the earth, so that the density of its crust may very likely be about the same as the earth's; but the weight of a given mass at the surface of Mars is only three eighths of the weight of the same mass on the earth. The strength of materials is therefore relatively much greater there, and mountains, animals, and buildings would naturally be much larger. The mean distance from the sun is 141,500,000 miles. The eccentricity of its orbit is very much greater than that of the earth, being 0.098 in place of 0.017; the inclination of its equator to its orbit is about the same. Its day is half an hour longer than ours. Its year is 687 of our days. The surface of Mars has been carefully mapped, and is characterized by the predominance of land and the great number of canals or straits. Its color is strikingly red. Its climate is, perhaps, not very different from that of the earth. It has two moons, discovered by Professor Asaph Hall in Washington in 1877, conformably to the prediction of Kepler, and realizing the fancies of Swift and of Voltaire. The inner of these, Phobos, revolves in less than 8 hours, so that to an observer on the planet it rises in the west and sets in the east; the outer, Deimos, revolves in 30 hours, so that it appears nearly stationary for a long time. The symbol of Mars is ♂, which seems to show the shield and spear of the god.

They have discovered two lesser stars, or satellites, which revolve about Mars, whereof the innermost . . . revolves in the space of ten hours, and the outermost in twenty-one and a half. *Swift, Gulliver's Travels, III. III.*

Brown, 1811), named after William Marsden (1754-1836), a British orientalist.] A genus of plants of the natural order *Asclepiadeae*, the milkweed family, type of the tribe *Marsdenieae*. It is characterized by having the crown adnate to the stamen-tube, and composed of five flat scales which are free at the apex,

and by a subrotated, campanulate, or urn-shaped corolla, with the lobes convolute to the right, or rarely subvalvate. They are twining shrubs, rarely suberect, with opposite leaves, and small or medium-sized purplish-green or whitish flowers, growing in terminal or axillary umbrellashaped cymes. There are about 55 species, natives of the warmer regions of the globe. *M. tenacissima* of India yields the valuable jutee-fiber. (See *jutee*.) *M. tinctoria*, also East Indian, produces a blue dye, whence it is called *indigo-plant*. The milky juice of *M. erecta*, of southeastern Europe, raises blisters on the skin, and taken internally is a violent poison. *M. suaveolens* of Australia is named *fragrant bower-plant*, and *M. viridiflora* is the native potato of New South Wales. See *cundurango*.

Marsdenia (mār-sē-nī'ō-ē), *n. pl.* [NL. (Benth. and Hooker, 1876), < *Marsdenia* + *-ea*.] A tribe of plants of the natural order *Asclepiadaceae*. The anthers are usually terminated by a hyaline or rarely opaque membrane, which is inflexed over the disk of the stigma or is suberect; the pollinia are erect and solitary in the cells, and are parallel with the margin of the stigma. The tribe embraces 36 genera and over 300 species, found throughout the world.

Marseillais, Marseillaise (mār-se-lyā', mār-se-lyāz' or mār-se-lāz'), *a. and n.* [F., masc. and fem. (< L. *Massiliensis*), < *Marseille* (> E. *Marseilles*), < L. *Massilia*, < Gr. *Massalia*, a town in Gallia Narbonensis settled by a Greek colony from Phocæa, now *Marseilles*. Cf. *Massilian*.] *I. a.* Belonging or pertaining to Marseilles, one of the chief seaports of France, situated on the Mediterranean. — *Marseillaise Hymn*, or *The Marseillaise*, the national song of the French republic, written in April, 1792, by Rouget de Lisle, an officer of engineers at Strasbourg, and called by him *War-Song of the Army of the Rhine*. The Parisians first heard it sung by a band of patriots from Marseilles, and gave it the name by which it has since been known. Rouget de Lisle himself asserted that he wrote both the words and the music in one night. His authorship of the former has never been disputed; that of the latter has frequently been, but apparently on quite insufficient grounds.

II. n. 1. A native or an inhabitant of the city of Marseilles. — *2.* The Marseillaise Hymn. See *I*.

marseilles (mār-sälz'), *n.* [So called from *Marseilles* in France.] A cotton fabric similar to piqué, stiff, and used for men's waistcoats and summer garments. — *Marseilles quilt*. See *counterpane*.

Marsenia (mār-sē-nī'ō-ē), *n.* [NL. (Leach, 1820).] A genus of gastropods, typical of the family *Marseniidae*.

Marseniidae (mār-sē-nī'ō-ē), *n. pl.* [NL., < *Marsenia* + *-idae*.] A family of tænioglossate pectinibranchiate gastropods, typified by the genus *Marsenia*. They possess a characteristic protrusible rostrum. They have a large thick mantle, a depressed truncate head with tentacles rising from its angles, eyes sessile at the outer base of the tentacles, and the teeth of the radula in three or seven rows. The rachidian tooth has a recurved unicuspid or denticulate apex. The shell is small and mostly entirely internal. The species inhabit all seas, and nearly 40 of them are known. Most, if not all, bore holes in ascidians and sponges to deposit their ova, and then cover the holes with special lids. Nearly all are dioecious, but a few are monœcious or hermaphrodite. Also called *Marseniada*, *Lamelliariidae*.

marsenioid (mār-sē-nī'ō-ē), *a. and n.* [< *Marsenia* + *-oid*.] *I. a.* Of or pertaining to the *Marseniidae*.

II. n. A member of the *Marseniidae*.

marsh (mārsh), *n.* [Also dial. *mash*; < ME. *marsh*, *mersch*, < AS. *mersc*, *mærsce*, *merisc* (= MD. *mersche*, *maersche* = MLG. *mersch*, *marsch*, *masch*, LG. *marsch*, > G. *marsch* = Dan. *mark*), a marsh, wet ground, prob. orig. 'a place full of pools,' < *mere*, a lake, pool, + *-isc*, E. *-ish*: see *mere* and *-ish*. (Cf. *mensch*, in which the same suffix appears as a noun-formative.) See *marsh*, an equiv. word of different history.] A tract of water-soaked or partially overflowed land; wet, miry, or swampy ground; a piece of low ground usually more or less wet by reason of overflow, or scattered pools, but often nearly or wholly dry in certain seasons; a swamp; a fen. Low land subject to overflow by the tides is called *salt-marsh* or *tide-marsh*.

And on the heyst of these hylles, and on the playn of these valeys, there were meruaylouse great *marshes* and dangerous passages.

Berners, tr. of Froissart's Chron., I. xviii.

A *marsh* here is what would in England be called a meadow, with this difference, that in our marshes, until partially drained, a growth of tea-trees (*Leptospermum*) and rushes usually encumbers them. . . . Such is our *marsh*—a fine meadow of 180 or 200 acres, and green in the driest season.

Mrs. Charles Meredith, My Home in Tasmania, p. 119.

Marsh bent. See *bent*. = Syn. *Bog*, *Quagmire*, *Slough*, *Swamp*, *Marsh*, *Morass*, *Fen*, *Moor*. Excepting *moor*, these words agree in denoting wet ground. A *bog* is characterized by vegetation, decayed and decaying, and a treacherous softness. A *quagmire* or *quag* is the worst kind of bog or slough; it has depths of mud, and perhaps a shaking surface. A *slough* is a place of deep mud, and perhaps

water, but generally no vegetation. *Slough*, *quagmire*, and *swamp* are the most suggestive of sinking in the mire. *Swamp* is rather broad in meaning; trees of certain kinds grow in *swamps*, but there is too much water to allow of agriculture or pasturage. In the United States, however, *swamp* is often used in the restricted sense of 'fresh-water marsh.' A *marsh* is frequently or periodically very wet, as the *salt-marshes* that are soaked by high tides; it may or may not be able to produce *marsh-grass* or small trees. A *morass* is the worst kind of marsh, large and too wet for valuable productiveness. A *fen* is a marsh abounding in coarse vegetation; a *moor* may or may not be wet, its distinguishing mark being the absence of forests. *Fen* and *moor* are little used in the United States.

marshal (mār'shal), *n.* [Formerly also *marshall*, *mareschal*, etc.; < ME. *marshal*, *marshal*, *marshalle*, *mareschalle*, < OF. *mareschal*, *marescal*, F. *maréchal* = Pr. *manescal* = Sp. 'horse-servant,' < *marsh* (= AS. *meark*), a horse, + *scalk* (= Goth. *skalks*), a servant: see *mare* and *shalk*.] *1.* An officer charged with the duty of regulating processions and ceremonies, deciding on points of precedence, and maintaining order: applied generally to such officers throughout the middle ages and in more recent times, usually with some explanatory term: as, *marshal of the palace*; *marshal of the lists*. The functions of the king's groom or farrier in various European countries were extended till the royal marshal became one of the highest military and civil officers; and the title of *marshal* was applied, with qualifications, to a large number of officers having similar duties. In England the king's marshal (along with the royal constable till the time of Henry VIII., and afterward alone) had charge of the ordering of arms, and of all matters of chivalry and knighthood, etc.; and he is still represented by the hereditary earl marshal (which see, under *earl*).

A seemly man oure hoste was withalle,

For to han been a *marshal* in an halle.

Chaucer, Gen. Prolog. to C. T., l. 752.

Shak., M. N. D., II. 2. 120.

Unask'd the royal grant; no *marshal* by,

As knightly rites require; nor judge to try?

Dryden, Pal. and Arc., II. 259.

2. A military officer of high rank, usually the highest under the chief of the state or the minister of war. In many countries the title is commonly modified by some other term: thus, in England, it has the form *field-marshal*; in Germany, *feldmarschall*; in France, *maréchal de France*.

3. In the United States, a civil officer appointed by the President, by and with the advice and consent of the Senate, in each judicial district, as the executive or administrative officer (corresponding to the sheriff of a county) for the United States Supreme Court, and for the circuit and district courts within his district. There are also marshals for the consular courts in China, Japan, Siam, and Turkey. United States marshals were formerly charged with the duty of taking the national census in their districts; the officers who take the State census in certain States are called *marshals* or *census marshals*.

4. An officer of any private society appointed to regulate its ceremonies and execute its orders. — *5.* In some universities, as in Cambridge, England, an officer attendant upon the chancellor or his deputy. — *Earl marshal*. See *earl*. — *Marshal of France* (*maréchal de France*), the highest French military dignity, the rank being conferred in recognition of services of special brilliancy in the field, as the winning of a pitched battle, or the taking of two fortified places. As the law has stood since 1830, the number of holders of the marshalship must not be raised beyond six in time of peace, but may be increased to twelve in time of war. The office has existed since the early middle ages. Originally subordinate to the constables of France, since the reign of Francis I. the title of *marshal of France* has had the importance which it still retains. — *Marshal of the field*, one who presided over any outdoor game. *Hallivell*. — *Marshal of the hall*, the person who, at public festivals, placed every one according to his rank. It was his duty also to preserve peace and order. *Hallivell*. — *Marshal of the King's* (or *Queen's*) *Bench*, formerly, an officer who had the custody of the prison called the King's (or Queen's) Bench, in Southwark. The act 5 and 6 Vict. c. xlii., abolished this office, and substituted an officer who is called *keeper of the Queen's prison*. — *Marshal of the king's* (or *queen's*) *household*. Same as *knight marshal* (which see, under *knight*). — *Marshal's staff*, a baton, variously proportioned, forming the badge of office of a marshal; especially, the long baton of the earl marshal of England. Two of them appear in the arms of the Duke of Norfolk, who holds the office of earl marshal as a hereditary right. They are crossed in saltire behind the shield, the ends only showing, and are represented as plain round staves, or capped at

each end by heads of slightly conical form, sable. — *Provoost marshal*. See *provoost*.

For example: A and B have a claim upon two funds, C has a claim upon one of them only. A and B can be compelled to satisfy themselves out of the fund to which C has not access, before resorting to the other, which constitutes the only source of payment for him.

age of the marshes it colonizes. It lays from 6 to 10 eggs of chocolate-brown color, but many of the nests never have eggs in them, being apparently built and used by the males alone. A variety of this species found in California is known as the *tule wren*. The short-billed marsh-wren, *C. stellaris*, is quite different, being almost entirely streaked above with black and white, besides the distinction implied in the name. It nests differently, lays white eggs, is less abundant, and is chiefly observed in the United States east of the Mississippi. The genus is widely distributed, and embraces 40 species, of which 4 are North American. *M. Drummondii* is the Australian nardoo. Sometimes written *Marsilia*.

fixed sacs within branchial apertures on each side, six or more in number, the lower jaw defective, and the mouth round like a sucker, whence the alternative name *Cyclostomi*. In the earlier systems the *Marsipobranchii* were regarded as an order or a subclass of fishes; they are now designated as a class of *Vertebrata*, and divided into two primary groups, *Hyperartia* and *Hyperotreta*, the former comprising the lampreys, the latter the hags. Both are known as *myzonts*. *Marsipobranchii* is a synonym of *Cyclostomi* and *Cyclostomata*. 2. See cut under lamprey.

the young; the marsupials or pouched animals. There being no developed placenta, the period of gestation is very brief, and the young are born extremely small, imperfect, and quite helpless. In this state they are immediately transferred to the pouch on the belly of the mother, where are the teats, to which the little creatures adhere firmly for a while, completing their development by sucking milk. As they grow larger and stronger, they are able to let go and take hold of the teat again; and even after leaving the pouch they may for a while retreat to it, or be carried about elsewhere on the mother's body. (See cut under *marmoset*.) The uterus is double, and the vagina also is more or less completely divided into two separate passages (whence the name *Didelphia*); the scrotum of the male is abdominal in position, and pendulous, in front of the penis. The corpus callosum is rudimentary, but the cerebral hemispheres are connected by a well-developed anterior commissure. The angle of the mandible is normally inflected. There is a wide range of adaptive modification in the structural details of the marsupials, the order in itself including representatives or analogues of nearly all the other orders of mammals, as the carnivorous, the insectivorous, the herbivorous, etc. At the present time the marsupials are eminently characteristic of the Australian region, only the *Didelphidae* or opossums being found in America; but in former epochs the distribution of the marsupials was general, and some of the oldest known mammalian fossils of Mesozoic age are supposed to belong to this order. It has been variously subdivided. Owen in 1859 divided it into five tribes, *Sarcophaga*, *Entomophaga*, *Carpophaga*, *Poiphaga*, and *Rhizophaga*. A main division, based on the dentition, is into *Diprotodontia* and *Polyprotodontia*. In 1872 Gill made the four suborders *Rhizophaga*, *Syndactyli*, *Dasyuromorpha*, and *Didelphimorpha*, with nine families, *Phascogomidae*, *Macropodidae*, *Tarsipedidae*, *Phalangistidae*, *Phascolaridae*, *Peramelidae*, *Dasyuridae*, *Myrmecobiidae*, and *Didelphidae*, for the living forms, and four fossil families, *Diprotodontidae*, *Thylacodontidae*, *Plagiatacidae*, and *Dromatheriidae*. Also called *Marsupata*.

Æthiops martialis. See *æthiops*. — **Martial law**, law imposed by the military power; that military rule or authority which exists in time of war, and is conferred by the laws of war, in relation to persons and things under and within the scope of active military operations, and which extinguishes or suspends, for the time being, civil rights and the remedies founded upon them, so far as this may be necessary in order to the full accomplishment of the purpose of the war. The person who exercises martial law is, however, liable in an action for any abuse of the authority thus conferred. It is the application of military government—the government of force—to persons and property within its scope, according to the laws and usages of war, to the exclusion of municipal government in all respects where the latter would impair the efficiency of military law or military action. *Benét*. See *military law*, under *military*.

The opposite of *martial* is *civil*, of *warlike* is *peaceful*, of *military* is *civil* or *naval*. *Warlike* applies most to the spirit or ingrained habits, as the *warlike* tribes of the north, but it also applies to that which is like war or naturally goes with war: as, *warlike* preparations; *warlike* rumors. *Martial* applies to that which is connected with war in a general way, or with war as active, and especially as appealing to the eye or the ear: as, *martial* music, din, pomp, appearance, array. *Military* applies more closely to things connected with the actual putting of soldiers into service: thus, a court *martial* is composed of military officers, and may therefore be called a *military* court; it applies *martial* law; its members appear in full-military dress.

1. A cover for the face with apertures for seeing and breathing; especially, such a cover, usually of silk or velvet, as worn at masquerades; a false face; a vizor. Ancient Greek and Roman actors wore masks covering the head as well as the face, made to simulate the characters represented, with hair and beard when required, and with mouth-pieces so formed as to swell the volume of the voice; and masks of various forms have continued to be used in mummeries and pantomimes: for the latter (as also at masked balls), commonly covering only the upper part of the face to the tip of the nose or the upper lip. Masks are often used for disguise, as during the commission of nefarious acts, and, under the name of *false faces*, usually grotesque or hideous, as toys for children; also sometimes by women to preserve the complexion, or as vehicles for the application of cosmetics. Masks of wire, gauze, etc., are used to afford protection to the face, as from splinters, dust, or smoke in glass-works, grinding-mills, and other factories, and also by fencers, firemen, and base-ball catchers.

3. A form of histrionic spectacle, much in vogue during the sixteenth and seventeenth centuries. It probably originated in the practice of introducing on solemn or festive occasions men wearing masks to represent mythical or allegorical characters. From a mere acted pageant, it gradually developed into a complete dramatic entertainment, in which the scenes were accompanied and embellished by music, and, in the hands of writers like Ben Jonson, Beaumont and Fletcher, and Milton, reached a high degree of literary excellence.

masoola-boat, **masulah-boat** (ma-sō'lä-bōt'), *n.* A large East Indian boat used on the Coromandel coast for conveying passengers and goods between ships and the shore. It is rowed sometimes with as many as sixteen oars. As the boat approaches the shore, the boatmen watch the opportunity

of a coming wave to drive it high on the beach, where it is quickly run up out of the reach of the next rolling wave. Also called *chelingue*. *Imp. Dict.*

There is a twofold Masora, a Babylonian or Eastern, and a Palestinian or Western, the former being the more important. The Masora not only takes account of various readings, but also contains notes of a grammatical and lexicographical character, including the system of Hebrew vowel-points first established by it. With much that is valueless, it contains all the material from which a critical revision of the Old Testament text can now be derived. Also written *Masorah* and *Massora*.

mass¹ (mās), *n.* [*ME. masse, messe*, < AS. *mæsse*, the mass, a church festival, = OS. *missa* = OFries. *missa* = MD. *misse*, D. *mis* = MLG. *missen* = OHG. *missa, messa*, MHG. *messe, misse*,

G. *messe* = Icel. *missa* = Sw. *missa* = Dan. *messe* = F. *messe* = Sp. *missa* = Pg. *missa* = It. *missa*, the mass, < LL. *missa*, dismissal, esp. the dismissal of a congregation, the mass, < L. *mittere*, pp. *missus*, send: see *mission*. The name *missa* is usually said to be taken from the words *ite, missa est*, 'go, it is the dismissal,' or 'go, dismissed' (the word *concio*, 'congregation,' being unnecessarily supposed to be omitted), thought to have been used at that point of the mass when the catechumens were dismissed, and the communion service followed; but it appears to have referred orig. to the dismissal of the congregation at the end of the mass, and to have been applied, by an easy transfer, to the service itself.] 1. The celebration of the Lord's Supper or eucharist.

That Office which was called the *Mass* by the mediæval and the Latin Church, but which we now call the Lord's Supper and the Holy Communion.

Procter, Hist. Book of Com. Prayer, p. 306.

The Supper of the Lord, and the Holy Communion, commonly called the *Mass*. *Book of Common Prayer* (1549).

2. The office for the celebration of the eucharist; the liturgy. The component parts of the mass or liturgy are the *ordinary of the mass* (*ordo missæ*) and the *canon of the mass* (*canon missæ*), succeeded by the communion (sometimes counted part of the canon) and post-communion. Anciently and technically the part preceding the offertory is the *mass* or *liturgy of the catechumens* (*missa catechumenorum*), the remainder the *mass* or *liturgy of the faithful* (*missa fidelium*). In the Roman Catholic Church different classes of masses are *high mass*, *low mass*, *private mass*, *novus mass*, etc. See the phrases below.

It needeth not to speke of the *messe* ne the seruise that thei hadde that day, for it were but losse of tyme. *Martin (E. E. T. S.)*, ii. 375.

And when our parish-masse was done,

Our kinge was bowne to dyne.

Sir Cautine (Child's Ballads, III. 176).

The time of the Communion shall be immediately after that the Priest himself hath received the Sacrament, without the varying of any other rite or ceremony in the *Mass*. *Order of the Communion* (1548).

The maiden buried, not as one unknown,
Nor meanly, but with gorgeous obsequies,
And *mass*, and rolling music, like a queen.

Tennyson, Lancelot and Elaine.

3. The sacrament of the eucharist or holy communion. The word *mass* in this and the preceding senses is popularly used of the eucharist as celebrated in the Roman Catholic Church, or of the teachings of that church with regard to the sacrament, as involving not only the doctrines of the real presence and the eucharistic sacrifice, held in some other churches also, but the doctrine of transubstantiation as defined by the Council of Trent. The use of the word *mass* (*missa*) in the Western Church is as old as the fourth century. The Greek Church has no term precisely corresponding to *mass*, the sacrament being generally called the *eucharist* or *holy communion*, and the office the *liturgy*. At the Reformation the first Prayer-Book (1549) of the Church of England retained the name *mass*, which was omitted in the second book (1552) and fell into disuse, being popularly regarded as involving a Roman Catholic view of the sacrament. The use of the word has, however, been revived to some extent among Anglicans in the present century. Swedish and Danish Protestants use the corresponding word for their own communion office.

4. A musical setting of certain parts of the Roman Catholic liturgy, also of corresponding parts of the Anglican liturgy. It consists usually of the following sections, each of which is sometimes divided into separate movements: Kyrie, Gloria (including the *Gratias agimus tibi, Qui tollis, Quoniam, Cum Sancto Spiritu*), Credo (including the *Et incarnatus, Crucifixus, Et Resurrexit, Sanctus* (including the *Hosanna*), Benedictus (including a repetition of the *Hosanna*), and the *Agnus Dei* (including the *Dona nobis*). To these an Offertorium (after the Credo and before the Sanctus) is sometimes added. The Requiem Mass differs largely from the regular mass, and includes settings of several of the stanzas of the hymn "Dies Iræ." The artistic form of musical masses varies widely, from unaccompanied plain-song to the most elaborate polyphony with orchestral accompaniments. Mediæval masses were named usually from the melody which was taken as the subject for contrapuntal treatment, as Josquin's mass "L'homme armé"; modern masses are named from the key of the first movement, as Bach's "Mass in B minor."

5. A church festival or feast-day: now only in composition: as, *Candlemas, Childermas, Christmas, Lammas, Martinmas, Marymas, Michaelmas, Roodmas* (compare *kermess*).—By the *mass*, an oath formerly in common use: sometimes abbreviated to *mass*.

Mrs. Page. Trust me, he beat him most pitifully.

Shak., M. W. of W., iv. 2. 214.

Middleton (and others), The Widow, iii. 3.

Capitular mass, in collegiate churches, high mass, celebrated on Sundays or festivals.—**Consummation of the mass**. See *consummation*.—**Conventual mass**, a solemn mass celebrated daily in cathedral and collegiate churches, in memory of and for the benefit of their founders.—**Dry mass, dry service**, a form of service, not properly a mass, consisting of part of the eucharistic office, but without consecration, such as the naval or nautical mass, or the mass of the pressanctified. The same name was also given to an office consisting of part of the

ordinary of the mass, and without either consecration, elevation, or communion: said in some places in the middle ages for strangers who came too late for the celebration. The Typics of the Greek Church have been compared to such an office. What is commonly known as the *Ante-communion Service* has sometimes been called by Anglican writers the *Dry Service* (*Missæ siccæ*).—**High mass**, a mass accompanied by music and incense, celebrated on Sundays, feast-days, and other special occasions by a priest or prelate, attended by a deacon and subdeacon.—**Low mass**, the ordinary mass, said, not sung, by the priest.—**Mass bell**. See *bell*.—**Mass for the dead**, a mass celebrated for a person or persons after their death; in the Roman Catholic Church, one celebrated for the purpose of hastening the release of a soul or souls from purgatory. The color of the vestments, etc., is black.—**Mass of the Holy Ghost**, a solemn mass for the Pope, the sovereign, or the state, and for all in union with the church or with a religious order. It is celebrated previous to a council or to the election of a bishop or abbot, and also at consecrations and coronations, or to obtain from God some special light or favor.—**Mass of the Pressanctified**. Same as *Liturgy of the Pressanctified*. See *liturgy*.—**Ordinary of the mass**. See *ordinary*.—**Private mass**. (a) *Low mass*. (b) Any mass where only the priest communicates, especially such a mass celebrated in a private oratory.—**Votive mass**, a mass which does not correspond with the office of the day, but is said at the choice of the priest.

mass¹ (mās), *v. i.* [*Mass¹, n.*] To celebrate mass.

mass² (mās), *n.* [*ME. masse*, < OF. *masse*, F. *masse* = Pr. *massa* = Sp. *masa* = Pg. 2. An assemblage or collection of incoherent particles or things; an agglomeration; a congeries; hence, amount or number in general: as, a *mass* of sand; a *mass* of foliage, of troops, etc.

Shak., Hamlet, iv. 4. 47.

5. The quantity of any portion of matter as expressed in pounds or grams, and measured on an ordinary balance with the proper reduction for the buoyancy of the atmosphere; otherwise, the relative inertia, or power in reaction, of a body. For example, if two bodies at rest, but free to move, as a gun suspended in vacuo and a bullet in it, are suddenly separated by a force acting between them, their respective velocities will be inversely as their *masses*, and this phenomenon best defines *mass*. It is usually confounded with weight, which is more properly the force with which a body is accelerated in the direction in which a plummet points, in consequence of the earth's attraction and rotation. Thus, if a piece of lead which is found to weigh a pound at the base of the Washington monument is transported to the top, it will be found to weigh a pound there, for its *mass* is unchanged. But if only the piece of lead and the balance are carried to the top of the monument, while the weight against which it has been weighed is left at the base, and then attached to the balance at the top by means of a long string or wire (the weight of which is to be properly allowed for), the piece of lead would be found to have lost the weight of one third of a grain, the weight thus varying though the *mass* does not.

The destructive effects of a cannon-ball are due entirely to its *mass* and to the relative speed with which it impinges on the target, and would be exactly the same (for the same relative speed) in regions so far from the earth or other attracting body that the ball had practically no weight at all. . . . When we open a large iron grate properly hinged, it is the *mass* with which we have to deal; if it were lying on the ground and we tried to lift it, we should have to deal mainly with its weight.

Tait, Properties of Matter.

The means employed are rubbing, kneading, and light pounding, combined ordinarily with more or less additional stimulation of the skin, as by friction and slapping. This manipulation furthers the removal of lymph from the parts, which is especially needful when the lymphatic flow is sluggish through lack

of muscular exercise; it apparently quickens the blood-circulation through the part, and furnishes gentle vasomotor exercise; it acts possibly as a direct trophic stimulus to muscular and sustentacular tissues; by stretching ligamentous structures it maintains or increases suppleness; in the abdomen it stimulates and aids peristalsis; and as a general stimulation of sensory nerves it may affect favorably the nutrition of the central nervous system. It is represented in the customs of many primitive peoples, and in a developed form constitutes a valuable resource of modern scientific therapeutics.

This oxid, separated from the grains of lead by sifting, and exposed to a heat sufficient to make it red-hot, but not to melt it, assumes a deep-yellow color. In this state it is called *massicot*, but does not differ chemically from litharge, though different in color and mechanical condition. After melting it has a reddish tint, and is called *litharge*. *Massicot*, slowly heated by a moderate fire, is further oxidized to minium or red lead. It is sometimes used as a pigment, and as a drier in the composition of ointments and plasters. Also called *lead-ocher*.

A mast is composed either of a single piece, or of several pieces united by iron bands. When it is of several pieces, it is called a *built mast* or a *made mast*. In all large vessels the masts are composed of several lengths, called *lower mast*, *topmast*, and *topgallantmast*. The royal mast is now made in one piece with the topgallantmast. A mast consisting of a single length is called a *pole-mast*. In a full-rigged ship with three masts, each of three pieces, the masts are distinguished as the *foremast*, the *mainmast*, and the *mizzenmast*; and the pieces as the *foremast* (proper), *foretopmast*, *foretopgallantmast*, etc. In vessels with two masts, they are called the *foremast* and *mainmast*; in vessels with four masts, the aftermast is called the *spanker-mast* or *jigger-mast*.

Naval ships of the most recent design are often provided with one military mast or more, carrying armored tops or platforms on which are mounted machine-guns. Such masts are also used for signaling and to provide stations for lookouts, and, in time of action, for small-arm men. Where more than one top is placed on a military mast, the lower one carries the machine-guns, and the upper the lookouts and small-arm men. Such masts are also fitted with derricks for hoisting torpedo-boats, etc., out and in.—*Sliding-gunter mast*, a small mast fitted for sliding upward on another mast by means of hoops or rings. 6. In *philos.*, consisting in or pertaining to matter in the Aristotelian sense, and not to form; arising from matter of positive fact, and not from logical implication; referring to the object as it exists, and not to distinctions originating in the mind; relating to a word as an object, and

not to its meaning. All these senses come down from the middle ages, and in them *material* is opposed to *formal*. In Cartesian and later writings, *material* often means pertaining to the outward world, as opposed to *spiritual*. In the Kantian terminology, *material* means pertaining to or derived from matter in the Kantian sense of that term, namely, that which is contributed to cognition by sense. Examples of the many established phrases in which this word occurs are given below.

7. In the *law of evidence*, of legal significance in the cause; having such a relation to the question in controversy that it may or ought to have some influence on the determination of the cause. See *immaterial issue*, under *issue*.—**Material acceptance** or **supposition**, the taking of a spoken or written word as an object of thought.—**Material being.** See *being*.—**Material cause.** See *cause*, 1.—**Material cognition.** See *cognition*.—**Material consequence,** a consequence, or premise with conclusion, which is valid—that is, of which the conclusion is true whenever the premise is true, but which is so by virtue of a matter of fact, and not by virtue of the logical forms of the premise and conclusion. The use of this term originated with Scotus, who further distinguishes between a necessary and a contingent material consequence, according as the premise needed to be supplied to render the consequence a logical syllogism is a necessary or a contingent proposition.—**Material criterion of truth.** See *criterion*.—**Material descent,** the passage from a genus to a species which comes under it as a matter of fact, but not by logical necessity.—**Material distinction,** the distinction between different individuals of the same species. This is an example of a use of the word *material* common with Thomas Aquinas and his followers, which seems to imply that matter is the principle of individuation.—**Material fallacy,** a fallacy in which the syllogism satisfies all the rules of formal logic, but where the deception belongs to a class of falsifications of premises. Such, for example, are cases where "most" is exaggerated into "all," where we argue *post hoc ergo propter hoc*, etc.—**Material form,** in *metaph.*, a form depending upon matter, and having no independent existence, which is supposed to be true of every form except the human soul.—**Material heresy.** See *heresy*, 2.—**Material idea.** See *idea*.—**Material knowledge.** Same as *material cognition*.—**Material logic.** See *logic*.—**Material matter of a proposition,** the subject and predicate: opposed to the *formal matter*, which is the fact signified by the proposition.—**Material mode,** a mode which affects the matter of a proposition: opposed to *formal mode*, which affects the form.

The *material modes* affect the matter of the enunciation, viz. either the subject or the predicate. For example, in this enunciation, A good shepherd lays down his life for his sheep, the word *bonus* or *good* is the mode of the subject. In this, A rhetorician speaks ornately and copiously, ornately and copiously are the modes of the predicate. Burgerdicius, tr. by a Gentleman.

Material multitudet, the plurality of a number in which the distinctions which may separate the objects are left out of view. It is a Thomist expression.—**Material object of a science,** the things of which that science takes cognizance, regardless of the point of view from which it considers them. Thus, chemistry and mechanics have the same material object—that is to say, the whole universe.—**Material opposition,** the opposition between terms which are not opposed in form.—**Material perfection of cognition,** a perfect acquaintance with the facts, as opposed to a logically distinct apprehension of them.—**Material principle,** the Aristotelian matter. See *matter*, 2 (a).—**Material science,** a science which rests on outward observation, and not on introspection: a Cartesian distinction.—**Material sign,** a sign which indicates its object, and shows its real existence, but does not represent it, or exhibit its form: a Thomist phrase.—**Material substance,** matter in the ordinary sense.—**Material supposition.** Same as *material acceptance*.—**Material truth,** the correspondence of our judgments with their objects: opposed to *formal truth*, which is mere logical consistency.—**Material unity,** that which belongs to an individual as such: a Thomist term.—**Material virtue,** a power residing in material things. Aquinas.

Fiske, Evolutionist, p. 277.*

Ward, Encyc. Brit., XX. 56.*

Cf. *mathematic, n.*] The science of quantity; the study of ideal constructions (often applicable to real problems), and the discovery thereby of relations between the parts of these constructions, before unknown. The observations being upon objects of imagination merely, the discoveries of mathematics are susceptible of being rendered quite certain. The first considerable advances in mathematics were made by the Greeks, whose greatest geometers, Euclid, Archimedes, and Apollonius, flourished in or about the third century B. C. After their time not very much progress was made until the seventeenth century, but since then the progress of discovery has been continuous. Crown matrimonial, in *Scot. Hist.*, the right to a share in the sovereignty conferred on the husband of a reigning queen. The extent of this concession appears never to have been precisely defined; but the common belief is that it implied a complete partnership in the crown, with remainder to the survivor and his or her heirs. [*L. matrix* (*matric-*), a breeding animal, the parent stem (of plants), *L.L.* the womb, a source, origin, cause, a public register or roll, *< mater* (= *Gr. μήτηρ*), mother: see *mater*², *mother*¹.] 1. The womb; the uterus.

Hence—2. That which incloses anything, or gives origin to anything, like a womb. (a) A mold which gives form to material forced into it in a solid condition, or poured into it in a fluid state and allowed to harden before removal. (b) In *coinage*, the intaglio formed in steel by engraving, or by driving into the metal a tool called a *hub*, upon which the design of the coin has been produced in relief. The steel matrix is subsequently hardened and tempered. From this matrix punches for making dies are obtained by driving into it pieces of soft steel, which, after taking form from the matrix, are in their turn hardened and tempered. The instruments used in coining thus alternately take the design in cameo and intaglio, and in order as follows: (1) cameo, the hub; (2) intaglio, the matrix; (3) cameo, the punch; (4) intaglio, the die. Lastly the coin is struck in cameo by the die. (c) The bottom die in any stamping- or drop-press. (d) In *type-founding*, an attachment to the mold in which the face of a type is cast, the mold proper making the body for that face. Every letter or character has its special matrix, but all the matrices of the same font are fitted to one mold. The matrix is a small flat bar of copper that has received the deeply sunken impress of the punch, or model letter cut on a rod of steel. As left by the punch it is known as a *drive*, or *strike*, or *unjustified matrix*. When finished and fitted to the mold it is a *justified matrix*. Matrices are also made by the electrotyping process. (e) In *stereotyping*, the mold of plaster, papier maché, or other composition which is taken from types as arranged in the form, and into which the melted alloy called *stereotypers' metal* is poured in casting stereotype-plates. (f) In *mineral* and *geol.*, the rock in which any accidental crystal, mineral, or fossil is embedded. (g) In *mining*, same as *gangue*, 1. [Rare and incorrect.] (h) In *odontol.*, the formative part of a mammalian tooth, consisting of a pulp and capsule. The former is converted into dentine, the latter into cement. (i) In *anat.*, the intercellular substance: as, the *matrix* of cartilage, containing corpuscles; the animal *matrix* of bone, impregnated with mineral salts, etc. (j) In *bot.*: (1) That upon which a plant is fixed or from which it grows: as, lichens which grow upon a *matrix* of rock. (2) Intercellular substance: as, the filaments of nostoc lie in a gelatinous *matrix*.

3. In *math.*, a rectangular array of quantities, usually square: so called because considered as a mold or set of compartments into which a certain number of quantities can be put, the leaving of one of the spaces unoccupied being in effect to put zero there. The matrix is consequently a multiple quantity having as many dimensions as it has spaces. The numbers in the spaces are called the *constituents of the matrix*. The following definitions relate to square matrices. The vertical lines of numbers are called the *columns*, the horizontal ones the *rows*. The diagonal running from the upper left hand to the lower right hand corner is called the *principal diagonal*. Constituents symmetrically situated with reference to the principal diagonal are said to be *conjugate*. A matrix in which every constituent is equal to its conjugate is said to be *symmetrical*; if all the constituents along each diagonal band transverse to the principal diagonal are equal, the matrix is said to be *perisymmetrical*. The addition of matrices is so understood that the sum of two like matrices is a matrix every constituent of which is equal to the sum of the corresponding constituents of the parts. The multiplication of two like square matrices is so understood that the product is a matrix whose construction is of the kind shown in the following example:

The same distinction exists between the verbs and between the nouns corresponding to these adjectives.

maxilla (mak-sil'ä), *n.*; pl. *maxillæ* (-ë). [*L.*, the jaw-bone, jaw, dim. of **macula* (*> mäla*, jaw), *< √ mac* in *macerare*, soften, macerate, = Gr. *√ μακ*, *μακ*, in *μάσσειν*, knead, *μάζα*, a kneaded mass: see *mass*, *magma*, etc.] In anat. and zool.: (a) A jaw or jaw-bone; a maxillary bone; especially, a bone of the upper jaw, as distinguished from the mandible. When the term is applied to both jaw-bones, they are distinguished as *maxilla superior* and *maxilla inferior*, the supramaxillary and inframaxillary bones. (b) Specifically, the supramaxillary bone proper, as distinguished from the premaxillary or intermaxillary, which is often fused therewith in the higher vertebrates. (c) In entom., as in insects and arachnidans, one of the second pair of gnathites; either one, right and left, of the second or lower pair of horizontal jaws, next behind or below the mandibles. In the maxillæ, thus forming the under jaw of insects, may be distinguished several parts, as the basal joint or cardo, the footstalk or stipes, the palp-bearing or palpiger, and the blade or lacinia. See cuts under *Hymenoptera*, *Insecta*, and *Brethrus*. (d) In Crustacea, the right or left one of either of the two pairs of gnathites which come next after the mandibles, between these and the maxillipeds. The maxillæ of a crustacean thus correspond to those of an insect, but there is an additional pair of them.—Composite maxillæ, dentate maxillæ, etc. See the adjectives.

maxillar (mak'si-lär), *a.* Same as *maxillary*.
Maxillaria (mak-si-lä'ri-ä), *n.* [NL. (Ruiz and Pavon, 1794), so called in allusion to the resemblance between the lip and column and the jaws of an animal, *< L. maxilla*, the jaw.] A genus of orchids of the tribe *Vandæ*, type of the subtribe *Maxillariæ*, characterized by an erect concave lip with erect lateral lobes and a fleshy column. They are epiphytes arising from pseudobulbs, with usually one or two flat leaves which are coriaceous, thin, or slightly fleshy. The flowers are large or of medium size, often beautiful and fragrant. There are about 120 species, natives of tropical America.

Maxillariæ (mak'si-lä'ri-ä), *n. pl.* [NL. (Bentham and Hooker, 1883), *< Maxillaria* + *-æ*.] A subtribe of the tribe *Vandæ* of the natural order *Orchidæ*, characterized by leaves that are not plaited and a column (or the part that bears the stamens and pistils) produced into a claw-like foot. It contains 9 genera, all American, and about 176 species.

maxillary (mak'si-lä-ri), *a.* and *n.* [*< L. maxillaris*, of the jaw, *< maxilla*, the jaw-bone,

Inferior Maxillary or Lower Jawbone of Man.
A, symphysis menti; *B*, angle of jaw; *C*, body or horizontal ramus; *D*, coronoid process; *E*, ascending ramus; *F*, condyle; the teeth inserted along the alveolar border. The concave line between *D* and *F* is the condyloid notch.

II. n. In *ornith.*, a part of the superior maxillary bone which projects inward, forming a palatal process, which may or may not meet its fellow in the midline of the bony palate. Its character and connections are various, and much used in the classification of birds. See cuts under *agilognathous*, *desmogonathous*, and *dromogonathous*.

Maximiliana (mak-si-mil-i-ä'nä), n. [NL. (Martius, 1831), named after *Maximilian* Alexander Philipp, Prince of Newwied.] A genus of palms of the tribe *Coccoinea* and subtribe *Eucoccoinea*, distinguished by the minute petals and six slightly exserted stamens of the male

As an independent verb, or as a quasi-auxiliary:
To have power; have ability; be able; can. In
the absolute original use, 'can,' now rare (being su-
perseded by *can*) except where a degree of contingency is
involved when the use passes insensibly into the later
uses. The uses of *may* are much involved, the notions of
power, ability, opportunity, permission, contingency, etc.,

passing into each other, and *may* in many constructions being purposely or inevitably used with more or less indefiniteness. The principal uses are as follows: (a) To indicate subjective ability, or abstract possibility: rarely used absolutely (as in the first quotation), but usually with an infinitive (not, however, as a mere auxiliary). See also *might*.

For and thou over me *myghtist*, as y over thee *may*,
Weel bittirli thou woldist me bynde.
Political Poems, etc. (ed. Furnivall), p. 167.

If thou consider the number and the manner of thy blisses

deny) that nart yet blisful.
Chaucer, Boethius.

Therefore whanne it *maite* not be aghenseld to these

folill.
Wycht, Acts xix. 36.

Thei turned a-noon to flight, who that *myght* sonest, so
that noon a-bode other.
Martin (E. E. T. S.), III. 534.

Ask me not, for I *may* not speak of it.
Tennyson, Holy Grail.

(b) To indicate possibility with contingency.
What-so-er thou be seruyd, loke thou be feyn,
For els thou may want it when thou hast nede.
Booke of Precedence (E. E. T. S., extra ser.), I. 59.

For she said within herself, If I *may* but touch his garment,
I shall be whole.
Mat. ix. 21.

Things must be as they *may*.
Shak., Hen. V., II. 1. 23.

I am confirm'd,
Fall what *may* fall.
Fletcher (and another), Queen of Corinth, I. 1.

Though what he learns he speaks, and *may* advance

Pope, Moral Essays, I. 8.

Let us keep sweet,
If so we *may*, our hearts, even while we eat
The bitter harvest of our own device.
Whittier, Amy Wentworth.

It *might* be May or April, he forgot,
The last of April or the first of May.
Tennyson, The Brook.

The young *may* die, but the old must!
Longfellow, Golden Legend, iv.

In this sense, when a negative clause was followed by a
contingent clause with *if*, *may* in the latter clause was
formerly used elliptically, *if I may* meaning 'if I can control
it' or 'prevent it'.

My body, at the leeste way,
Ther shal no wight defoule, *if I may*.
Chaucer, Franklin's Tale, I. 690.

"Sey boldly thi wille," quod he,
"I nyl be wroth, *if* that I *may*,
For nought that thou shalt to me say."
Rom. of the Rose, I. 3099.

Sometimes *may* is used merely to avoid a certain bluntness
in putting a question, or to suggest doubt as to whether
the person to whom the question is addressed will be able
to answer it definitely.

How old *may* Phillis be, you ask,
Whose beauty thus all hearts engages?
Prior, Phillis's Age.

The preterit *might* is similarly used, with some slight addition
of contempt.
Who *might* be your mother,
That you insult, exult, and all at once,
Over the wretched?
Shak., As you Like it, III. 5. 35.

(c) To indicate opportunity, moral power, or the absolute
power residing in another agent.
As I shalle devyse you, suche as theif ben, and the names
how thei clepen hem; to suche entent, that see *moore*
knowe the difference of hem and of othere.
Mandeville, Travels, p. 58.

(d) To indicate permission: the most common use.
Thou *mayest* be no longer steward.
Luke xvi. 2.

An I *may* hide my face, let me play Thisby too.
Shak., M. N. D., I. 2. 53.

I *might* not be admitted.
Shak., T. N., I. 1. 25.

In this sense *may* is scarcely used now in negative
clauses, as permission refused amounts to an absolute
prohibition, and accordingly removes all doubt or contingency.
(e) To indicate desire, as in prayer, aspiration,
imprecation, benediction, and the like. In this sense
might is often used for a wish contrary to what can or
must be: as, O that I *might* recall him from the grave!

May you live happily and long for the service of your
country.
Dryden, Ded. of Æneid.

Certain as this, O! *might* my days endure,
From age inglorious and black death secure.
Pope, Iliad, viii. 667.

That which I have done,
May He within himself make pure!
Tennyson, Passing of Arthur.

(f) In law, *may* in a statute is usually interpreted to mean
must, when used not to confer a favor, but to impose a duty
in the exercise of which the statute shows that the public
or private persons are to be regarded as having an interest.

B. As an auxiliary: In this use notionally
identical with *may* in the contingent uses
above, in A (b), but serving to form the so-

called compound tenses of the subjunctive or
potential mode, expressing contingency in con-
nection with purpose, concession, etc. *May* is so
used—(1) In substantive clauses, or clauses that take the
place of or are in apposition with the subject or object or
predicate of a sentence: introduced by *that*.

It was my secret wish *that* he *might* be prevailed on to
accompany me.
Byron.

They apprehended *that* he *might* have been carried off
by gipales.
Southey.

I heard from an old officer that when in the West Indies
he was told by a lady, at whose house he was dining, *that*
he *might* not like the soup, as it was made from snakes.
N. and Q., 7th ser., II. 335.

(2) In conditional clauses. [Rare, except in clauses where
permission is distinctly expressed.]
Lands, goods, horse, armour, anything I have
Is his to use, so Somers set *may* die.
Shak., 2 Hen. VI., v. 1. 53.

(3) In concessive clauses.
Whatever the stars *may* have betokened, this August,
1749, was a momentous month to Germany.
G. H. Lewes.

A great soul *may* inspire a sick body with strength; but
if the body were well, it would obey yet more promptly
and effectually.
J. F. Clarke, Self-Culture, p. 55.

(4) In clauses expressing a purpose.
Was it not enough for thee to bear the contradiction of
sinners upon Earth, but thou must still suffer so much at
the hands of those whom thou didst for, that thou *mightest*
bring them to Heaven?
Stillingfleet, Sermons, I. vi.

Constantius had separated his forces that he *might* di-
vide the attention and resistance of the enemy.
Gibbon.

4. Intermediate in a number of greater and less values, quantities, or amounts; forming an average between two or more terms of any kind; average; specifically, in *math.*, having a value which is a symmetrical function of other values of the same sort, such that, were all those other values to be equal, the value of the function would be equal to them all (compare II., 4): as, the mean breadth of a country; the mean distance of the earth from the sun.

Those constitutions which can bear in open day the rough dealing of the world must be of that mean and average structure — such as iron and salt, atmospheric air and water.

See *center¹*. — **Focus of mean motion.** See *focus*. — **Mean anomaly.** See *anomaly*, 2. — **Mean apogee.** See *apogee*, 1. — **Mean cleft,** in musical notation, the C cleft, because once specially used for the mean or middle voices. — **Mean distance, ecliptic, effort.** See the nouns. — **Mean error.** See *error*, 5. — **Mean line, in crystal,** a bisectrix: the first mean line is the acute, the second mean line the obtuse bisectrix. — **Mean longitude** of the sun, moon, or a planet, in *astron.*, the celestial longitude which the body would have at any moment if, starting from perihelion, it moved in its orbit with a uniform angular velocity, completing its revolution in the same time it actually employs in making the circuit. The mean and true longitudes agree therefore at perihelion and aphelion. — **Mean moon,** an imaginary moon, supposed to move with an equable motion in the ecliptic, and in the same period as that which the real moon takes to perform a revolution with an unequable motion. — **Mean noon,** the moment when the mean sun passes the meridian. — **Mean place, in logic,** a place which partly agrees with the nature of the things to be proved, and partly differs from the same. The mean places are conjugates, cases, and divisions. — **Mean position, in fencing,** a position of the wrist midway between pronation and supination, with the thumb above the fingers. *Rolando* (ed. Forsyth). — **Mean proportional,** the second of any three quantities in continued proportion. — **Mean solar day.** See *day¹*, 8. — **Mean space¹,** meanwhile.

Mean spaces entreat our freinds not to be too busie in answering matters, before they know them.

Cushman, quoted in Bradford's *Plymouth Plantation*, p. 55.

Mean sun, in astron., an imaginary or fictitious sun, moving uniformly in the celestial equator, and having its right ascension always equal to the sun's mean longitude. Its hour-angle at any moment defines the mean time or clock-time, just as the hour-angle of the actual sun defines the apparent or sun-dial time. The use of the mean sun in time-reckoning is necessitated by the fact that, owing to the eccentricity of the earth's orbit and the inclination of the equator to the ecliptic, the sun's real motion in right ascension is seriously variable, and the days, hours, etc., of apparent solar time have, therefore, no fixed length. See *day¹*, 8. — **Mean term, in logic,** same as *middle term* (which see, under *middle*). — **Mean time,** a system of reckoning time, such that all the days and their like subdivisions are of equal length, its day being the mean interval between the two successive passages of the sun over the meridian of any place. The mean time at any moment may be defined as the hour-angle of the mean sun at that moment. (See *mean sun*.) Mean time is the time usually employed for civil and scientific purposes, and is the time indicated by an ordinary clock or watch, properly regulated. Apparent time is that indicated by a correctly adjusted sun-dial; the difference between the mean and the apparent time at any moment is called the *equation of time*, and sometimes slightly exceeds a quarter of an hour. — **Mean voice, in music,** a voice or voice-part intermediate between the highest and the lowest, as a tenor or an alto. — **Mean way¹,** meantime.

In the meane way they [Lerius and his fellows] passed by the Tapeimry Paralyse, Ouetacata, all which, howsoever they exercise hostilities and mutual disagreements, yet agree in like barbarous and rightlesse Rites.

Purchas, *Pilgrimage*, p. 887.

Capt. John Smith, *Works*, l. 136.

(c) Either the second or the third string of a viol, the former being the *small mean*, and the latter the *great mean*. — 4. A quantity having a value intermediate between the values of other quantities; specifically, in *math.*, the average, or *arithmetical mean*, obtained by adding several quantities together and dividing the sum by their number. In general a mean is a quantity which depends upon certain other quantities according to any law which conforms to these two conditions: first, that, if the quantities which determine the mean should all be equal, the mean would be equal to any one of them; and second, that no transposition of the values of the determining quantities among themselves can alter the value of the mean. (See *geometrical mean*, below.) The ancients recognized ten kinds of mean (*arithmetic, geometric, harmonic, contraharmonic, subcontraharmonic, subharmonic, subcontraharmonic, subgeometric, subarithmetic*), distinguished by ordinal numbers, to which Jordanus Nemorarius added an eleventh. Only the first four, the arithmetical, geometrical, harmonical, and contraharmonical, are true means.

5. In logic, the middle term in a syllogism. — 6. A mediator; an intermediary; an agent; a broker; a go-between.

— *Syn.* 1. *Mean, Medium, Average, Mediocrity.* Mean and medium represent the middle point or degree. Mean is much used in mathematics. (See *arithmetical mean, geometrical mean*, etc., above.) Mean is also much used in morals: as, in conduct we are to observe the golden mean; Aristotle held that each virtue was a mean between vice of defect and a vice of excess. Medium has this latter sense, but is used chiefly in matters of practical life: as, goods that are a medium between the best and the poorest; a color that is a medium between two others. In this sense medium is much used as an adjective: as, a medium grade, color, price. Means is the form of mean that corresponds to medium when it stands for that which, by being between others, is the agency for communication, etc. As mean and medium generally imply simply two extremes, but may imply several quantities of different amounts or degrees, so average may imply simply two extremes, but generally implies several quantities of different amounts or degrees: as, the average of 3, 5, 7, and 9 is 6. The latter word has similar figurative uses: as, the man's education was better than the average. Mediocrity is now used only in an unfavorable sense, implying blame or contempt: as, talents not above mediocrity — that is, very moderate. — 7. Instrument, method, mode, way, expedient, resource, appliance.

mor, G. *mase*, a spot, speckle, as on wood or on the skin; dim. of MD. **mase* = MLG. *mase* = OHG. *māsa*, MHG. *māse*, G. *mase*, a spot, the mark of a wound; whence also ult. *mase*, a bowl or of spotted wood: see *mase*. The word *measles*, ME. *measles*, *masales*, is entirely distinct from ME. *mesel*, a leper, whence *meselry*, leprosy, but has been more or less confused with it, as in MD. *mesel-sucht*, MLG. *mesel*, *mesel*, *mesel-sucht*, *suke*, defined as "the measles-sickness" (Hexam), or measles, but prop. the 'leper-sickness,' or leprosy. The words *mesel*, *meselry* became nearly obsolete before the 17th century; in ME. the words were pronounced differently. Hence the equiv. *measlings*, q. v. The singular *measle* (def. 1, above) appears to have been developed from the plural (which is now used as singular), in the sense 'a spot like those of measles,' and not in the orig. lit. sense (in MD., etc.), of 'a little spot.' 1. The period of eruption usually lasts about four days. The eruption is succeeded by a bran-like desquamation. The poison is conveyed directly from the patient through the air and by fomites. It is given off in the period of invasion as well as in later periods. Also called *rubella* and *morbilli*.

11. In *pros.*: (a) Determination of rhythm by division into times or groups of times; rhythm, as so determined; meter. In ancient prosody the unit of measure is the primary time or mora. See *mora*. (b) A group of times or syllables used to determine the length of a colon, period, or meter. In ancient prosody the *measure* was sometimes a single foot (monopody), and sometimes a pair of feet (dipody). Iambic, trochaic, and anapestic rhythms were as a rule measured by dipodies, other meters by monopodies. The *measure* was marked as such by beating time, the secondary ictus of a dipody not receiving the beat. According to the number of *measures* contained in it, a meter was designated as *monometer*, *dimeter*, *trimeter*, etc., and these terms are those still in use for modern poetry, some writers, however, counting every foot a *measure*.

12. In *music*: (a) One of the groups of tones or of accents included between any two primary or heavy accents or beats. A *measure* always begins with such a primary accent, and includes one or two (or even more) secondary accents, with various possible lesser accents. Most rhythms may be reduced to *measures* having either one primary and one secondary accent or one primary and two secondary accents, the former rhythm being called *duple* and the latter *triple*. *Measures* are indicated in printed music by bars, one of which is placed before each primary accent. All the notes between two bars are said to belong to the same *measure* or bar. The essential structure of the *measures* in a given piece of music is indicated at the beginning by the rhythmical signature. See *signature*. (b) Same as *tempo*. [Rare.]—13. Peel's measures were finished laws before they were brought forward. W. R. Greg, Misc. Essays, 2d ser., p. 224.

16. *pl.* In *geol.*, a set or series of beds, as in *coal-measures*, the assemblage of strata in which the coal of any particular region occurs.—17. In *fencing*, the distance of one fencer from another at which the one can just reach the other by lunging. To come into measure is to approach an opponent near enough to reach him with the sword-tip by thrusting and lunging.—Above or beyond measure, to an indefinitely great degree or extent; exceedingly.

Absolute measure. See *absolute*.—**Angular measure**, the system of units employed for measuring angles. It is based on the measurement of the circumference of a circle described with the vertex of the angle as its center. The circumference is regarded as divided into 360 equal parts called *degrees*; a right angle is thus the angle subtended at the center by the fourth part of the circumference, or is 90 degrees. The table is:

60 seconds (60")	= 1 minute (1')
60 minutes	= 1 degree (1°)
360 degrees	= 1 circle or circumference.

Apothecaries' measure, the system of units employed by apothecaries in compounding and dispensing liquid drugs. The table in use in the United States is:

Gallon.	Pints.	Fluidounces.	Fluidrachms.	Minims.
1	= 8	= 128	= 1024	= 61440
	1	= 16	= 128	= 7680
		1	= 8	= 480
			1	= 60

The capacity of the gallon is 231 cubic inches. The pint of the British Pharmacopœia (being the eighth part of the gallon of 277.274 cubic inches) is divided into 20 fluidounces, with the fluidrachm and minim constituting the same subdivisions of the fluidounce as in the above table. The cubic capacity of the gallon can, however, be stated only approximately. The standards are made to contain a certain weight of water at a certain temperature. See *gallon*.

—**Barren measures.** See *barren*.—**Binary measure.** See *binary*.—**Cartesian measure of force.** See *Cartesian*.—**Circular measure.** Same as *angular measure*.—**Cloth-measure**, the standard system of lineal units employed in measuring cloth. The table is:

Yard.	Quarters.	Nails.	Inches.
1	= 4	= 16	= 36
	1	= 4	= 9
		1	= 2½

The English ell is 5 quarters, and the Flemish ell about 3 quarters. See *ell*.—**Common measure.** See *common*.—**Compound measure.** See *compound*.—**Cubic measure**, the system of units employed for measuring volume, formed from long measure by taking the cubes of the lineal dimensions. The table is:

Cubic yard.	Cubic feet.	Cubic inches.
1	= 27	= 46656
	1	= 1728

Decimal measure. See *decimal*.—**Dry measure**, the system of units ordinarily used in measuring dry commodities, such as grain, fruit, etc. The table is:

Quarter.	Bushels.	Pecks.	Gallons.	Quarts.	Pints.
1	= 8	= 32	= 64	= 256	= 512
	1	= 4	= 8	= 32	= 64
		1	= 2	= 8	= 16
			1	= 4	= 8
				1	= 2

A pottle is 2 quarts; a load of grain is 5 quarters, and a last 10 quarters. The approximate capacity of the Imperial (British legal) bushel is 2,218.192 cubic inches; of the Winchester (United States legal) bushel, 2,150.42 cubic inches. (See *apothecaries' measure*.) The United States bushel is thus equivalent to .96946 British bushel.—**Gravitation measure of force.** See *gravitation*.—**Greatest common measure** of two or more numbers or quantities, the greatest number or quantity which divides each of them without a remainder.—**Heaped measure.** See *heap*, v. f.—**Imperfect measure.** See *imperfect*.—**In a measure**, to some extent.—**Lineal or linear measure.** See *long measure*, below.—**Liquid measure**, the system of units ordinarily used in measuring liquids. The table is:

Gallon.	Quarts.	Pints.	Gills.
1	= 4	= 8	= 32
	1	= 2	= 8
		1	= 4

For the capacity of the gallon, see *apothecaries' measure*.—**Long measure, lineal or linear measure**, the system of units ordinarily used in measuring length. The table is:

	1	= 40	= 220	= 660	= 7920
		1	= 5½	= 16½	= 198
			1	= 3	= 36
				1	= 12

Other units considered as belonging to long measure are the pace, 5 feet; the fathom, 6 feet; the span, 9 inches; the hand (used in measuring the height of horses), 4 inches; the surveyors' chain or Gunter's chain, of 100 links, 66 feet; the engineers' chain, of 100 links (United States), 100 feet (see *link*). See also *cloth-measure*, above.—**Measure of a number or quantity, in math.**, a number which is exactly contained in another two or more times.—**Measure of a ratio**, its logarithm in any system of logarithms, or the exponent of the power to which the ratio is equal, the ex-

Which we devise him.

Sp. mesurar* = *Pg. mensurar*, *mesurar* = *It. misurare*, < *L. mensurare*, *measure*, < *mensura*, *measure*: see *measure*, n. Cf. *mensuration*.] I. *trans.* 1. To ascertain the length, extent, dimensions, quantity, or capacity by comparison with a standard; ascertain or determine a quantity by exact observation. To measure a length, a standard of length is employed; this is laid down so that its beginning coincides with the beginning of the length to be measured, and its other end is marked; it is then laid down again in the same way, with its first end where its last end previously came, and so on, counting the number of times it is laid down. Finally, if there remains a length less than that of the standard, this is measured by subdividing the length of the standard into a sufficient number of equal parts, and using one of these as a secondary standard. Measurements are also effected by reference to units of area or of capacity, as well as by means of weighing, etc.

through the air, and of other *mechanical* motions, . . . is
not seen at all.

Bacon, Nat. Hist., § 98.

5. Effected by material force or forces; consisting in the play of material forces: as, *mechanical* pressure.

I doubt, however, if a view which recognizes only a *mechanical* course of Nature can logically do anything with such ideas as those of reverence, and so forth, but reckon them among the morbid productions of imagination to which nothing real corresponds, and of which it has already learnt to reject so many.

Lotze, Microcosmus (trans.), II. 100.

6. mechanics (mē-kan'īks), *n.* [*Pl. of mechanic*: see *-ics*.] 1. The theory of machines. This is the old meaning of the word, especially before the development of the modern doctrine of force.

I do not here take the term *Mechanics* in that stricter and more proper sense wherein it is wont to be taken when it is used only to signify the doctrine about the moving powers (as the beam, the lever, the screws, and the wedge), and of framing engines to multiply force; but I here understand the word *Mechanics* in a larger sense, for those disciplines that consist of the applications of the pure mathematics to produce or modify motion in inferior bodies.

Boyle, Works, III. 435.

2. The mathematical doctrine of the motions and tendencies to motion of particles and systems under the influence of forces and constraints; in a narrower sense, this doctrine as applied to systems of rigid bodies. *Mechanics* is now commonly divided into *kinematics* and *dynamics*, and the latter into *statics* and *kinetics*. *Mechanics* treated by means of the infinitesimal calculus is called *analytical mechanics*. The fundamental principles of mechanics are stated under *energy and force*; but the science is characterized by the great number of derived principles made use of. See *principle*.

Newton defined the laws, rules, or observed order of the phenomena of motion which come under our daily observation with greater precision than had been before attained; and, by following out with marvellous power and subtlety the mathematical consequences of these rules, he almost created the modern science of pure mechanics.

Huxley, in Nineteenth Century, XXI. 489.

G. medaille = Dan. medalje = Sw. medalj) = Sp. medalla = Pg. medalha = It. medaglia, ML. reflex medallia, medalia, medalea, medalla, medale (> OHG. medilla, medila, MHG. medele), a medal, < LL. as if *metallea, < L. metallum, metal: see metal.*] A piece of metal, usually circular in form, bearing devices (types) and inscriptions, struck or cast to commemorate a person, an institution, or an event, and distinguished from a coin by not being intended to serve as a medium of exchange. The word is also sometimes used to designate coins, particularly ancient coins in the precious metals, or fine medieval or Renaissance coins in collections. Some of the Greek and Roman coin-types are commemorative, and the Roman medallions were of a quasi-medallic character. Strictly speaking, however, the medal is a creation of modern times. The earliest, and in point of portraiture the finest, medals were produced in Italy about the middle of the fifteenth century by Vittore Pisano of Verona. Fine medals were also executed in Italy, Germany, and France during the sixteenth century. English medals begin practically with the reign of Henry VIII. The earliest specimens are cast, but in the reign of James I. the process of striking began to be employed. Thomas Rawlins, Thomas Simon, and Abraham Simon (seventeenth century) are the principal medalists who were natives of England; but some of the best English medals were the productions of foreign artists, as Trezzo (time of Philip and Mary), Simon Passe (James I.), N. Briot (Charles I.), the Roettier family (Charles II.), and J. Croker (Anne).

An antique medal, half consumed with rust.

Boyle, Works, V. 545.

Italian and French writers of the fifteenth and sixteenth centuries use *medaglia* and *medailles* to signify coins which, being no longer in circulation, were preserved in the cabinets of collectors as curiosities. Even in the last century our own word *medal* was so employed. The *medals* of the Roman Emperors to which Gibbon often alludes in his notes to the "Decline and Fall" are, of course, what are now known as coins; and Addison's "Dialogue upon the Usefulness of Medals" is, for the most part, a treatise on Roman imperial coins.

Usually these coins are so inset that both sides can be seen, the interior of the cup as well as the exterior being in this way made ornamental. medalet (med'al-et), *n.* [*< medal + -et.*] Any medal of small size. When not larger than, for example, the English florin or half-crown, or United States half-dollar, medals are generally called by this name; but numismatists do not make any rigid distinction between medals and medalets.

I shall beg leave to give this class the appellation of *medalets*, as the genius of our language admits of this diminutive in ringlet, bracelet, and the like.

1. To make mediate; reduce from an immediate or direct to a mediate or indirect relation through the interposition of a secondary superior or controlling agency. Applied specifically to the process of converting one of the minor German states or princely families of the old empire from the semi-independent condition of having a direct share in the imperial government, and responsibility to it, to that of subordination to an intervening power, by being annexed to it while retaining all local possessory and governmental rights. By this process, especially under the Westphalian treaties of 1848, and the changes leading to the dissolution of the old empire and the formation of the Confederation of the Rhine in 1806, the number of mediatized states and princely families became very large.

The same peace [that of Lunéville] declared that all the secular princes who had lost territory by this cession were to be indemnified by the Empire. This was done at Regensburg in 1803. The indemnifying material was obtained by *mediatizing* all the free cities but six, and all the spiritual estates but two. *Lowie, Bismarck, Int.*, p. vi. Medieval architecture, the most important branch of medieval art, including a great number of varied styles. This architecture embodies a union of the Greek system

of columnar construction with the Roman vaulting and arches, with the consequences flowing logically from the new combination. It may be considered as originating

about A. D. 300, in the palace of the Emperor Diocletian at Spalato, in which arcades were introduced supported on free-standing shafts instead of the Roman piers with engaged columns, and in which the profile of the architrave was continued around the archivolt, which had usurped the architrave's function, and now sprang directly from the capital, abandoning the meaningless Roman interposition between archivolt and column of a small section of a mock entablature. Despite local differences, medieval architecture represents a continuous development from the classical Roman to the modifications wrought by the Renaissance. At its origin, copying Roman models, it was poor and rude, owing to the lack of skill and of resources in its builders. Every succeeding generation sought to perfect the system of vaulted ceilings to which the characteristic forms of this architecture are due. The application of the Roman groin vault was extended and brought into new combinations; the pointed arch and vault were evolved, as possessing more stability and elasticity than the old round-arched forms; and finally the use of ribs to strengthen and support the vault was elaborated. By about 1225 medieval architecture could solve with the utmost economy and artistic excellence any problem that could be presented to masonry construction. From about 1250 architects, embarrassed no longer by inherent difficulties, began to lose the simple beauty of their style in unnecessary elaboration of details, as in complicated window-traceries and in distorted profiles of moldings; and architecture progressively declined, so that the simplification of external forms effected by the Renaissance was a gain. But the sound and scientific medieval methods of construction remained in great part beneath the Renaissance exterior, and indeed are not yet wholly abandoned, especially in France. Many fanciful theories have been formed as to the origin of medieval architecture, especially that deriving its groin vaulting from an imitation of the lines of interlacing branches in an avenue of trees. It was, however, in fact a thoroughly logical growth from classical models, and the result of consistent efforts to adapt means to the ends sought. Thus, the problem in a great church or hall was to cover in securely a large space with as few interruptions as possible to sight and sound; hence the tendency to widen the arches and to reduce the thickness of the pillars. The great height of such buildings was not induced by a desire to "soar heavenward," but by the necessity to secure light for the nave by windows pierced above the roofs of the aisles. The typical decoration of this architecture is of the highest beauty and fitness, ornamenting but not making the construction; and, while based chiefly on natural forms, it always, until the decline of the style, conventionalized these appropriately to their architectural function. This architecture attained its best development in France. See *Byzantine, Romanesque, Pointed*, etc.—*Medieval art*, the art of the entire middle ages in Europe, beginning in the gradual transformation of classical forms and ideals, and extending to the Renaissance, or, roughly, to the year 1500, though in Italy it actually became merged earlier in the new current of modern art, and in the north, as in England and Germany, it continued later. It embraces a countless number of regional and local styles and schools, yet all animated by a kindred spirit. It is second in importance in art-history only to the art of Greece; and, while in many ways it fell far short of Greek art, the course of its development from rude beginnings was very similar, and, like the Greek, presents a consecutive and sincere effort on the part of succeeding craftsmen and artists constantly to do better. Its ideal of beauty was less high than that of the Greeks; it was more of a didactic art, seeking, in its illuminations and painting and sculpture, to illustrate and enforce the teachings of the Bible and the inherent imperfection of man. Yet the general similarity of methods of observation and work was so close that in France especially, after the close of the archaic period in the thirteenth century, much figure-sculpture was produced, as that in the portals of the cathedral of Rheims and on the north transept of that of Rouen, which is in spirit thoroughly Greek, and is equal to all but the best Greek draped work. In decoration medieval art was preeminent. Like Greek art, it was understood and appreciated not by a small cultivated class, but by the whole people. It consistently sought to give to the commonest tools and utensils beautiful forms and characteristic ornament; while the architectural sculpture and decorative combinations of forms have never been surpassed in their variety, in their beauty of execution, and in their fitness to the ends which it was sought to attain. To the general artistic sentiment, religious fervor, and emulative spirit of the period most of the great cathedrals, embodying, like a Greek temple, the best architecture and sculpture and the best decoration of the day, owe their origin.—*Medieval history*, Latin, etc. See the nouns.

megalithic (meg'-a-lith'ik), *a.* [*Gr. megalith* + *-ic*.] Consisting of megaliths or very large stones: as, *megalithic monuments*; the *megalithic architecture* of Egypt. The word *megalithic*, however, as now almost exclusively used, has reference to a peculiar class of monuments or remains, of which the most essential feature is that the stones used in their construction in a vast majority of cases have nearly or quite their natural form. Hence these remains, in so far as they consist of stone, have been designated as "rude stone monuments." The stones used in them are frequently, but not always, of very large size. The menhir and dolmen are perhaps the most characteristic of the various forms of megalithic construction (see these words), but circles and avenues or alignments of standing stones, as well as tumuli or barrows of earth, either covering or inclosing dolmens, and frequently surrounded by one or more rows or circles of upright stones, are almost equally common and characteristic. The region especially notable for the number and variety of its megalithic remains extends from northern Africa through France and Great Britain to Scandinavia. The most remarkable display of the various forms is in Algeria, in Brittany, in Cornwall and various districts in southwestern England and Wales, as well as in parts of Ireland and Scotland; also in northern Germany, Denmark, and southern Scandinavia. There are also great numbers of dolmens and tumuli in India, especially in the hills of Khasia, where such monuments are still being erected.

To the same primitive period (the Neolithic) of rude savage life must be assigned the rudiments of architectural skill pertaining to the *Megalithic Age*. Everywhere we find traces, alike throughout the seats of oldest civilization and in earliest written records, including the historical books of the Old Testament Scriptures, of the erection of the simple monolith, or unhewn pillar of stone, as a record of events, a monumental memorial, or a landmark.

Encyc. Brit., II, 333.

But it is in Egypt that *megalithic* architecture is seen in its most matured stage, with all the massiveness which so aptly symbolises barbarian power. *Encyc. Brit.*, II, 333.

The *megalithic* structures, menhirs, cromlechs, dolmens, and the like . . . have been kept up as matters of modern construction and recognized purpose among the ruder indigenous tribes of India. E. B. Tylor, *Prim. Culture*, I, 55.

= *E. singer*.] A mastersinger; specifically, a member of one of the societies or guilds formed during a period ranging from the fourteenth to the sixteenth century in the principal cities of Germany (the most celebrated at Nuremberg) for the cultivation of poetry and music. These societies were composed mostly of workmen, and succeeded to the field occupied before their time by the Minnesänger, who had usually belonged to the aristocratic classes. They founded schools in which their art, called *Meistergesang*, was taught according to strict rules constituting a system called *tabulatur*. They practised chiefly lyrical poetry, generally on a biblical subject, sung with an accompaniment of some stringed instrument, as the harp, violin, etc. Before admission to the degree of *Meister* (master) it was necessary, as a rule, to pass through four preparatory degrees: viz., *Schüler* (scholar), *Schulfreund* (schoolfellow), *Dichter* (poet), and *Singer* (singer). The candidate for admission to the guild had to present a poem and its musical accompaniment, which must receive the approval of four judges, called *Meister*, who examined the diction, grammatical construction, meter, rhyme, and melody. The *Meistersänger* claimed to trace their origin back to the middle of the tenth century, but their earliest school is alleged to have been founded at Mainz about 1312 by Frauenlob, one of the last of the Minnesänger, and schools were established afterward in all the principal cities of Germany. After the Reformation the guilds gradually became extinct, but the school at Ulm continued in existence until 1839.

Melchite (mel'-kit), *n. and a.* [*MGr. Μελχίτης, < Syriac melkāyē, Ar. malekiya, milkīya, lit. royal, < melk, king.*] 1. *n.* An orthodox Eastern Christian as distinguished from a Monophysite or Nestorian. The name was originally given to the Orthodox as belonging to the imperial church, the title of *king* being that which was commonly given in Greek and in Oriental languages to the Roman and to the Byzantine emperor. Although the term *Melchite* is older than the Council of Chalcedon (A. D. 451), its wider use dates from its adoption after that council by the Monophysites, who rejected the decrees of the council, and employed this name to represent the Orthodox as receiving them merely in submission to the edict of the emperor Marcian. The name *Melchite* is sometimes given also to members of communities of Christians in Syria and Egypt, formerly in communion with the Orthodox Greek Church, who have submitted to the Roman see.

Those Syrian Christians who, though not Greeks, followed the doctrines of the Greek Church as declared at the Council of Chalcedon, were called by their opponents, by way of reproach, *Melchites*, 'royalists' or 'imperialists,' because they submitted to the edict of Marcian in favour of the decrees of the Council of Chalcedon. *Isaac Taylor, The Alphabet*, I. 291.

Among the Orthodox some were adherents of Meletius, and therefore known as *Meletians*; others remained separate, and were known (from the last canonically ordained bishop, Eustathius, then dead) as *Eustathians*. Further difficulty was occasioned by the two orthodox parties using the word *hypostasis* (which see) in different senses. The schism between them continued till the end of the century.

It is distinguished by a small, fleshy, subglobose or obovoid legume, which is indehiscent or at length two-valved. L. F. Ward, *Dynam. Sociol.*, II. 468.

2. The doctrine that the world is neither the worst nor the best possible, but that it is capable of improvement: a mean between theoretical pessimism and optimism.

W. R. Sorley, *Ethics of Naturalism*, p. 271.

The only good reason for referring to the source [of the word *meliolism*] . . . that you found it useful for the doctrine of *meliolism* to cite one unfashionable confessor of it in the face of the fashionable extremes.

In her general attitude toward life, George Eliot was neither optimist nor pessimist. She held to the middle term, which she invented for herself, of *meliorist*. She was cheered by the hope and by the belief in gradual improvement of the mass.

II. a. Of or pertaining to meliorism or meliorists.

If we adopt either the optimist view or the *meliorist* view—if we say that life on the whole brings more pleasure than pain, or that it is on the way to become such that it will yield more pleasure than pain, then these actions by which life is maintained are justified, and there results a warrant for the freedom to perform them.

It depends essentially upon tones of relative pitch, successively arranged. (b) A series of tones so related to one another as to produce a distinct musical phrase or idea. The underlying relationship may be variously established: by any particular rhythmic arrangement, as in some popular dance-tunes; by the intervals of a single chord, as in arpeggio phrases; by a diatonic order, as in scale passages; by the harmonic connections between successive chords of which the melody in question forms one of the voice-parts, as in simple choral writing; and by innumerable

It is *concrete* or *conjoint* when it proceeds by single degrees, upward or downward; *discrete* or *disjunct* when it proceeds by steps of more than a single degree. It is *syllabic* when but one tone is given to each syllable of the words; *sturred* when more than one tone is given to a syllable. A melody may be further described as *popular*, *national*, *artistic*, etc.

The strip of paper is afterward punctured along the marks of the record, and passed through another machine, which, by means of the perforation, closes the circuit of a small electromotor and works a perforator. The perforator is then made to reproduce a stiff paper stencil, which is an exact copy of the written record. The stencil may then be used in the melotrope for the reproduction of the music.

A herbaceous succulent trailing annual plant, *Cucumis Melo*, natural order *Cucurbitaceæ*, or its fruit, the muskmelon. The plant is not known in a wild state, but its origin was referred by De Candolle to the region of the southern Caspian. It has been cultivated from time immemorial in the hot countries of the East, the melons of Persia being specially celebrated, and is now planted wherever there is sufficient summer heat to mature its fruit. The latter at its best is very rich and highly flavored. It is an ellipsoid or globular pepo, the edible part of which is the inner layer of the pericarp, the stringy and watery placenta with the seeds being rejected. The melon is grown in numberless varieties, as the cantaloup, the nutmeg, etc. In the United States this fruit, in all its forms, is known as *muskmelon*—*melon* being applied indifferently to it and the watermelon, or even by preference to the latter. =*Syn.* To mollify, subdue; *Melt*, *Dissolve*, *Thaw*, *Fuse*. Two words, . . . popularly confounded, though scientifically very distinct, are *melt* and *dissolve*. The former signifies to bring a substance from a solid to a liquid condition by the agency of heat alone; the latter signifies the bringing about of this result by distributing the particles of the substance acted on among the particles of another substance which is itself liquid, and this process is termed the *solution* of the solid substance. *Thaw* differs from *melt* in being applicable only to substances whose ordinary condition is that of a liquid, and which have become solid in consequence of the abstraction of heat, and therefore return to the liquid condition as if of themselves. (*Chambers's Journal*.) *Dissolve* is much used as a synonym of either *melt* or *thaw*. *Fuse* is sometimes synonymous with *melt* (as, to *fuse* a wire by electricity), but it is more often used of melting together: as, bell-metal is made by *fusing* copper and tin.
